

BRE Announces New Rare Earth Discovery - the Pelé Project

- Discovery of a new district-scale rare earth exploration project, named the 'Pelé Project', located circa 60km southwest of Monte Alto
- The Pelé Project is highly prospective for ultra-high grade REE-Nb-Sc mineralisation with a district-scale exploration target area that is +30 times larger than Monte Alto
- Pelé discovered using the exploration pathfinders that successfully delineated the world-class ultra-high grade Monte Alto Project, including intense geophysical anomalies, confirmed hard rock REE outcrops and high-grade monazite sands at surface
- Initial ground reconnaissance at Pelé Target 1 has discovered the largest continuous hard rock monazite outcrop found since exploration commenced at the province, and it currently extends over a strike of ~30m (open) within a larger 1km NNE potential outcrop trendline
- This large-scale monazite outcrop recorded gamma readings comparable to the ultra-high grade REE-Nb-Sc mineralisation at Monte Alto, which returned exceptional grades of up to 5.9% (59,100ppm) NdPr¹, 3,229ppm DyTb¹, 1.5% niobium and 352ppm scandium
- High-grade monazite sand intercepts of up to 11.5% TREO from the first batch of re-assays from Rio Tinto drill holes across the Pelé exploration target, with assays pending for 220 high-priority drill holes (2,700m) that cover Pelé's intense geophysical anomalies
- Comprehensive gamma line surveys will be expedited over the highly prospective 15km exploration corridors on Pelé Targets 1-4 in preparation for a maiden diamond drilling program

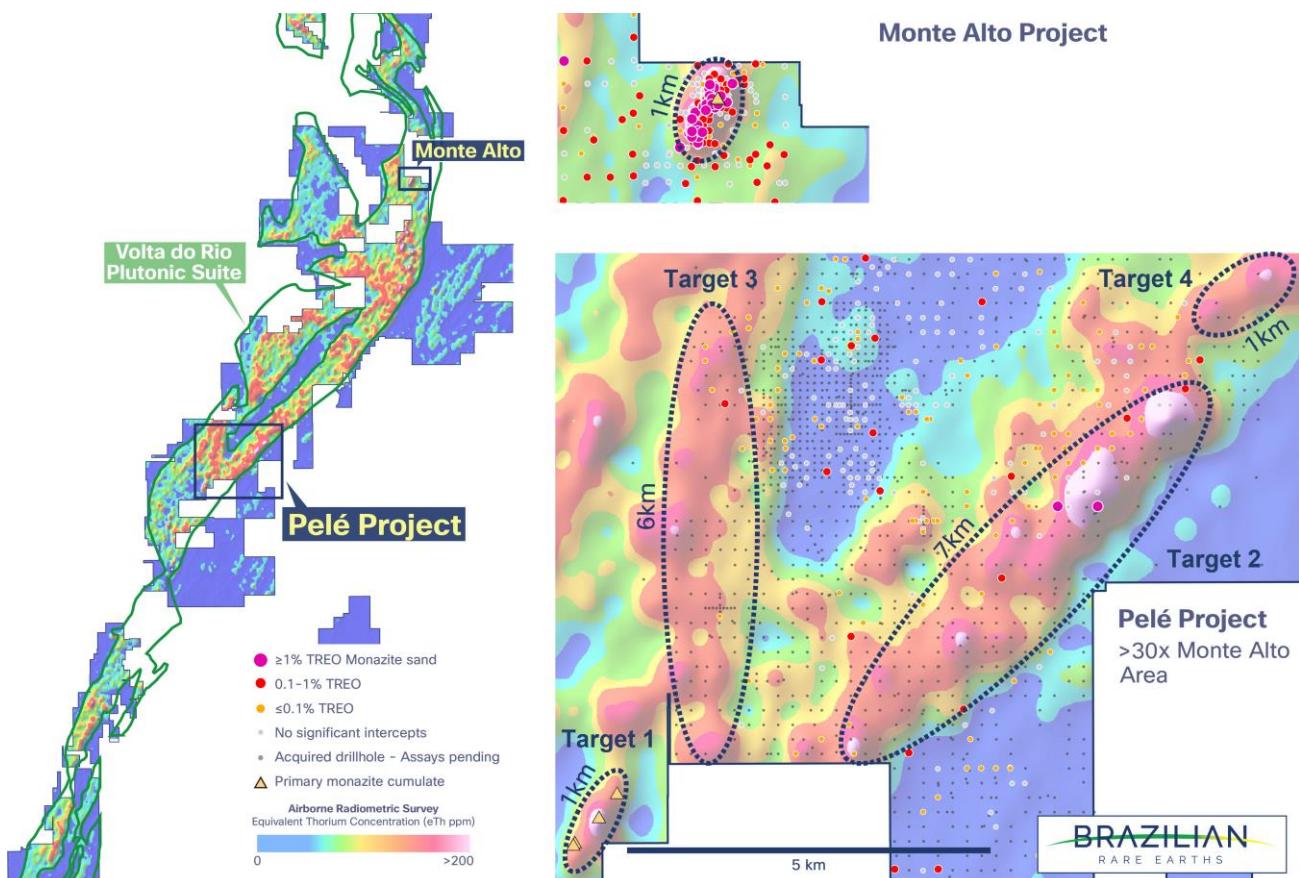

Figure 1: Scale of the Pelé Project relative to the Monte Alto Project

Note ¹: TREO = Total Rare Earth Oxides; NdPr = Nd₂O₃ + Pr₆O₁₁; DyTb = Dy₂O₃ + Tb₄O₇

Brazilian Rare Earths Limited (ASX: BRE) (BRE) is pleased to report the first batch of re-assay results from the Rio Tinto exploration dataset and the receipt of new assays from BRE drilling across the Rocha da Rocha Rare Earth Province in Bahia, Brazil.

A new rare earth discovery, the Pelé Project, has been made ~60km southwest of Monte Alto. This greenfield discovery is highly prospective for ultra-high grade REE-Nb-Sc mineralisation, with multiple exploration pathfinders indicating the scale of a world-class rare earth mineralised system.

Pelé contains the most extensive area of intense geophysical anomalies within BRE's province-scale ~4,000km² landholdings. Pelé Target 1 is distinguished by the largest continuous hard rock monazite cumulate outcrop discovered since exploration commenced at the province, and it currently extends over a strike of ~30m (open) within a larger 1km NNE potential hard rock outcrop trendline.

The latest assay results from the wider regional exploration program and the initial results from the Rio Tinto re-assay program confirm the exceptional potential for new rare earth discoveries across BRE's landholdings. These exploration landholdings were strategically acquired to secure control of the Volta do Rio Plutonic Suite mineralised trendline that stretches over 160km down the spine of the Rocha da Rocha Rare Earth Province (Figure 2).

The Volta do Rio Plutonic Suite (VRPS) is hosted within the Archean age Jequie Complex and forms the prime exploration target zone for ultra-high grade REE-Nb-Sc mineralisation. The VRPS is distinguished by a bi-modal formation of granitoids and REE-Nb-Sc rich leucogranites. The high-grade REE-Nb-Sc leucogranites are layered within the province scale VRPS from the separation progression of the parent magma.

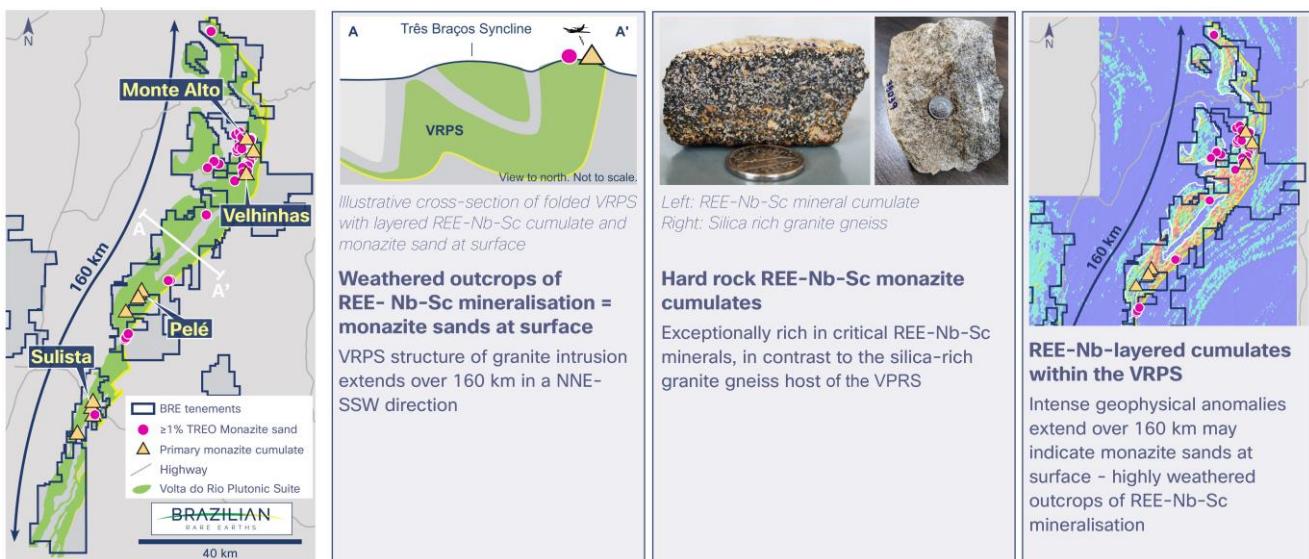

Figure 2: Volta do Rio Plutonic Suite (VRPS)

Brazilian Rare Earths' CEO and MD, Bernardo da Veiga, commented:

"Less than two years after the discovery of the Monte Alto project we are pleased to announce our fourth greenfield rare earth project at this world-class rare earth province."

The Pelé Project is district-scale rare earth project with an exploration target area that is over 30 times larger than the Monte Alto Project. The scale of the exploration opportunity is exceptional and the recent discovery of a massive monazite mineralised outcrop at Pelé Target 1 indicates the potential for a major rare earth endowment.

With the proven Monte Alto exploration pathfinders already at hand at Pelé, and the extensive assay results from the Rio Tinto dataset now imminent, we now intend to accelerate plans for a maiden diamond drilling program at Pelé."

Monte Alto Project – Successful Exploration Pathfinders

The discovery of the world-class Monte Alto project was based on three key exploration pathfinders:

- Geophysical anomaly: BRE's proprietary airborne radiometric survey defined an intense geophysical anomaly over Monte Alto
- Monazite sands: Auger drilling at Monte Alto intersected high grade (+1% TREO) monazite sands near surface. These monazite sands represent a highly weathered 'outcrop' of REE-Nb-Sc mineralisation and a significant indicator for potential ultra-high grade REE-Nb-Sc mineralisation at depth
- Hard rock REE-Nb-Sc outcrops: The discovery of REE-Nb-Sc boulders and outcrops supported the exploration model for ultra-high grade REE-Nb-Sc mineralisation at depth

BRE completed a comprehensive gamma line survey at Monte Alto to map a high-grade monazite sand corridor which then underpinned the design of the maiden diamond drilling program. This maiden diamond drilling program successfully discovered ultra-high grade REE-Nb-Sc mineralisation at Monte Alto.

Pelé Project Discovery – Confirmed Exploration Pathfinders

The Pelé Project has been discovered using the same exploration pathfinders that were successfully proven at the ultra-high grade Monte Alto Project.

- Geophysical anomaly: Airborne radiometric survey data across the Pelé Project area defines a cumulative 15km chain of intense geophysical anomalies for targeted exploration
- Monazite sands: The first batch of re-assays from Rio Tinto auger drilling returned high grades of up to 11.5% TREO. As with Monte Alto, the exploration model is that these monazite sands represent highly weathered 'outcrops' of REE-Nb-Sc mineralisation
- Hard rock outcrops: Initial field reconnaissance at Pelé discovered extensive monazite cumulate outcrops with comparable gamma readings to the ultra-high grade mineralisation at Monte Alto

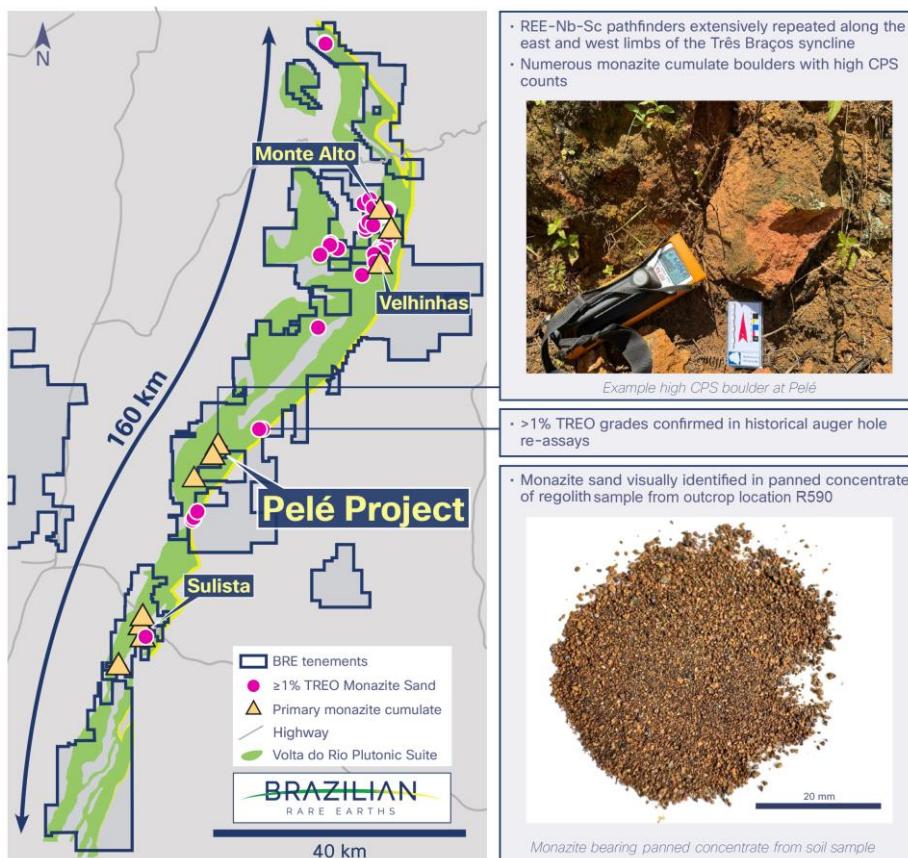

Figure 3: Pelé REE-Nb-Sc exploration pathfinders

Pelé Geophysical Anomaly

Analysis of the airborne radiometric data over the Pelé Project identified an extensive chain of intense anomalies recurring on the eastern and western limbs of the regional Tres Bracos syncline. These anomalies across Pelé Targets 1-4 have a cumulative strike of ~15km and define a highly prospective exploration target area that is over 30 times larger than the Monte Alto project (Figure 4).

Pelé Ground Reconnaissance - Large-scale Monazite Outcrop Discovery

The BRE exploration team recently conducted initial ground reconnaissance exploration over the southern zone of the Pelé Project area (Pelé Target 1). A gamma spectrometry survey quickly discovered the largest continuous hard rock monazite outcrop found since exploration commenced at the province, which currently extends over a strike of ~30m (open) within a larger 1km NNE potential outcrop trendline (Figure 4 and 5).

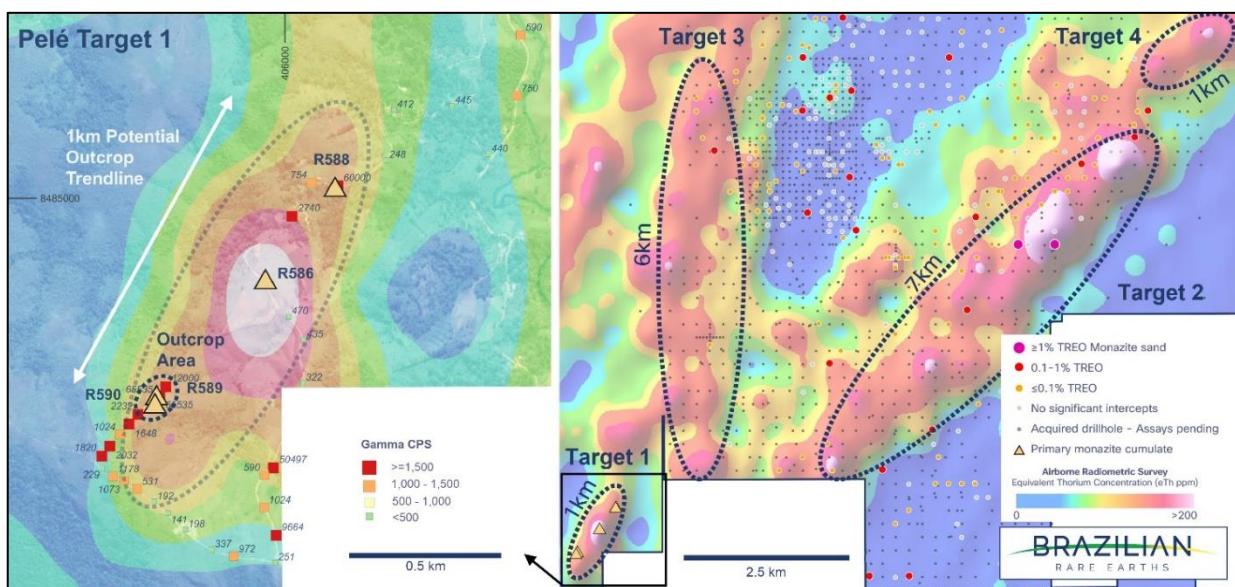

Figure 4: Pelé Target 1 outcrop locations and 1km trendline

Figure 5: Mineralised hard rock outcrop, Pelé Target 1

BRE geophysicists used a RS-230 Portable Gamma Spectrometer positioned over the outcrops to measure a Count of gamma particles Per Second (CPS). There is an established strong correlation between high CPS readings and the high grade REE-Nb-Sc mineralisation at the Monte Alto project.

Gamma spectrometry has thus proven to be an effective method to identify primary high-grade REE-Nb-Sc mineralisation throughout the entire province. This ground based geophysical survey method led to the discovery of REE-Nb-Sc mineralisation at the Monte Alto, Velhinhos and Sulista projects.

High CPS values were recorded at multiple outcrops along an extensive 1km trendline at Pelé Target 1, located at the south-western extent of the Pelé Project exploration area (Figure 4). Ground based surveys recorded CPS values ranging from 12,000 to the maximum detectable level of 65,500 at sites R589 and R590 (see Figure 6).

These gamma survey sites define a large-scale monazite cumulate outcrop that currently strikes ~30m and is open (Figure 7), within a larger 1km NNE potential hard rock outcrop trendline. The recorded CPS values are comparable to those measured for the ultra-high grade REE-Nb-Sc mineralisation at Monte Alto and represent an intensity of ~20 to 50 times the background CPS values for the region.

Figure 6: Pelé Target 1 outcrops - CPS values above the detection limit, indicative of Monte Alto style ultra-high grade REE-Nb-Sc mineralisation

Figure 7: Large-scale monazite mineralised outcrop at Pelé Target 1, extending ~30m of strike (open) within a 1km potential outcrop trendline

Rio Tinto Re-Assay Program

The highest priority Rio Tinto auger drill samples that cover the VRPS and key geophysical anomalies have now been dispatched for re-assay. Exploration assay results for over 11,000m of these high-priority drill holes are expected in the coming months.

The first batch of the rare earth re-assays that cover the Pelé target confirmed shallow mineralisation with grades of +1% TREO, and monazite sands have been visually confirmed in the drill hole samples.

Significant assays from the surface saprolite include:

- 19m at 4.2% TREO from 0.5m, with 20.8% of NdPr and 1.2% of DyTb (AMBX3124)
- 14m at 0.5% TREO from surface, with 19.4% of NdPr and 0.9% of DyTb (AMBX3141)
 - Including 3.5m at 10.7% TREO from 3.5m, with 19.2% of NdPr and 0.9% of DyTb, and
 - 1m at 10.4% TREO from 13m, with 20.8% of NdPr and 1.1% of DyTb (AMBX3141 - open at depth)
- 2m at 1.1% TREO from 9m, with 19.5% of NdPr and 0.6% of DyTb (AMBX1492)

The first batch of re-assays included results from 152 Rio Tinto drill holes at the Pelé target with an average depth of 14m. These holes targeted the upper laterite layer and, as such, the REE enriched saprolite horizons below this depth remain largely untested. The highest-grade rare earth assay value of 0.5m at 11.5% TREO was intersected at the end of hole MBX3141 at 13.5m, with the mineralisation open at depth. BRE will deploy auger and sonic drilling to extend the exploration into the REE enriched saprolite horizons.

As illustrated in Figure 8 below, the Pelé exploration target area is extensively covered by shallow Rio Tinto auger drilling and there are 220 pending re-assay results (~2,700m) that are expected to be received in the coming months.

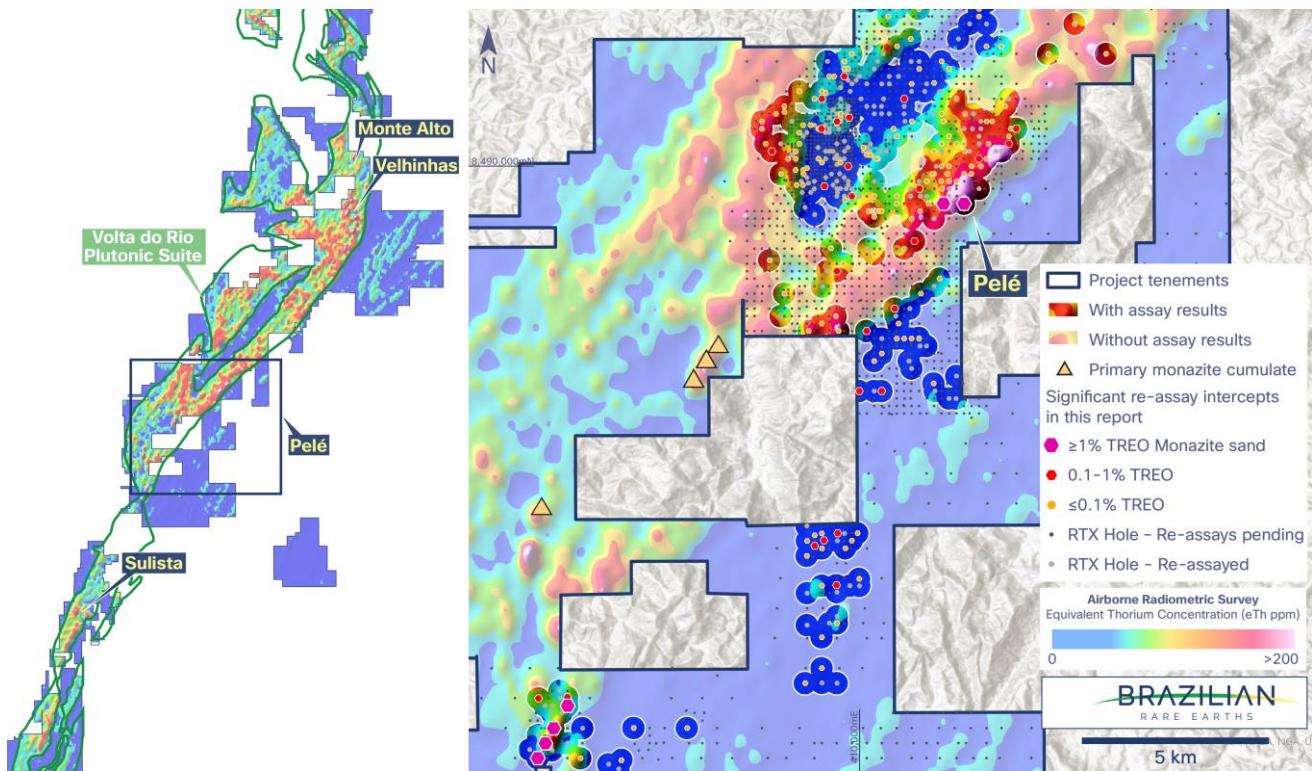

Figure 8: Initial re-assay and exploration results at the Pelé REE-Nb-Sc exploration project

Surface Drilling at Monte Alto and Velhinhas Projects

In addition to the Phase II diamond drilling campaign underway at the Monte Alto project, an auger drilling program has advanced across the project area to extend the monazite sand resource estimate of 25.2 Mt at 1.0% TREO.

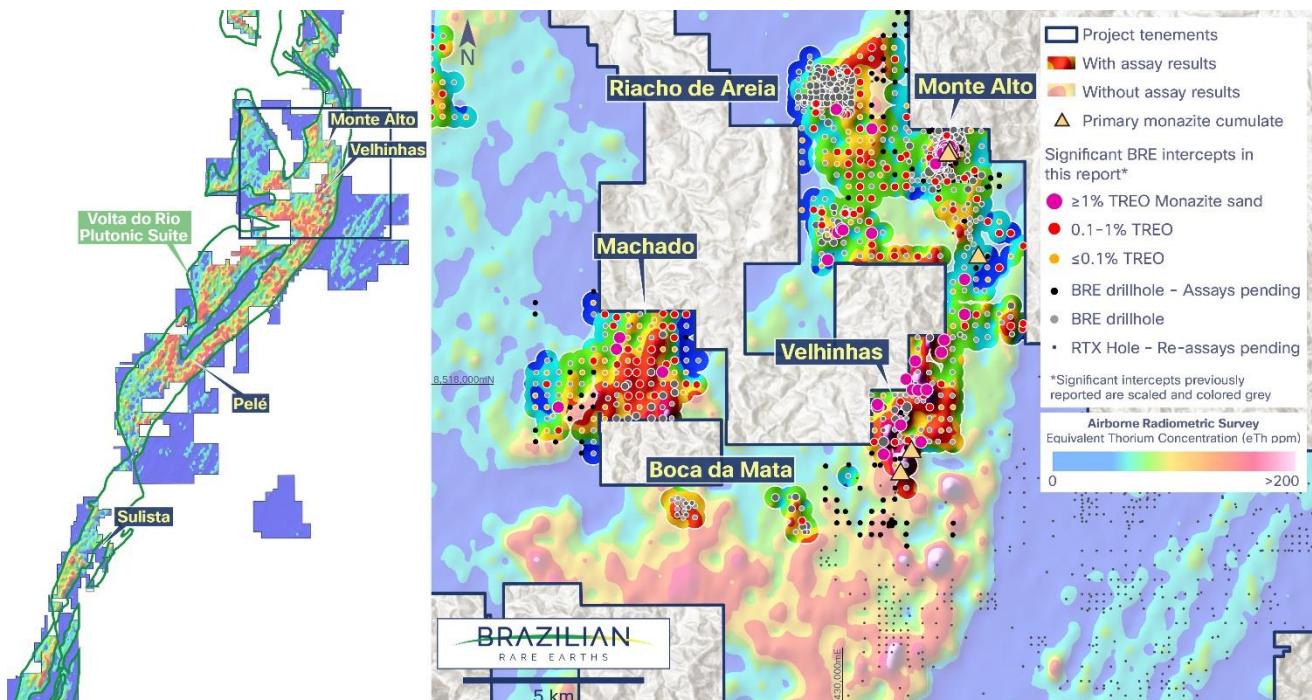

Figure 9: Exploration results at the Monte Alto and Velhinhas projects

Auger drilling across the Monte Alto exploration project area continues to discover shallow high-grade rare earth mineralisation. Significant new rare earth assays include:

- 21.9m at 1.9% TREO from surface, with 13.3% of NdPr and 0.7% of DyTb (STU0957)
 - Including 1.9m at 10.4% TREO from 20m, with 14.4% of NdPr and 0.8% of DyTb (STU0957 - open at depth)
- 19m at 4.8% TREO from surface with 14.9% of NdPr and 0.8% of DyTb (STU0969 – open at depth)
 - Including 7.5m at 10.5% TREO from 0.5m, with 14.5% of NdPr and 0.8% of DyTb (STU0969)
- 15m at 2.6% TREO from 9m, with 18.1% of NdPr and 0.9% of DyTb (STU0551)

Significant new assays from the shallow auger drilling exploration program at the Velhinhais project include:

- 13.5m at 0.9% TREO from surface, with 17.8% of NdPr and 0.9% of DyTb (STU0596 – open at depth)
 - Including 4m at 2.8% TREO from 4m, with 18.0% of NdPr and 0.9% of DyTb (SSU0097)
- 19m at 1.3% TREO from surface, with 17.1% of NdPr and 0.7% of DyTb (STU0867)
 - Including 5m at 4.6% TREO from 4m, with 17.3% of NdPr and 0.6% of DyTb (STU0867)

Next Steps

The highest priority Rio Tinto auger drill samples that cover the VRPS and key geophysical anomalies have now been dispatched for re-assay. Exploration assay results for over 11,000m from these high-priority drill holes are expected in the coming months.

At Pelé Target 1, detailed ground reconnaissance and gamma line surveys will be expedited over the potential 1km monazite cumulate outcrop trendline. Once the extensive outcrops and surface rock formations are systematically mapped, this highly prospective exploration trendline will be drill ready for step-back holes to explore the full extent of the mineralised system at depth.

Comprehensive gamma line surveys will be conducted over the highly prospective ~15km exploration corridors at Pelé Targets 2, 3 and 4 to assist with the design of targeted diamond drilling exploration programs.

The Phase II extension and infill diamond drilling campaign at the Monte Alto project remains on schedule and is expected to be completed by mid-year.

At the Sulista Project, the diamond drillhole to twin the historical high-grade REE-Nb-Sc intercept has been completed and dispatched with the historical core samples for laboratory assays. Mineralized intercepts +1% TREO from within the historical database of ~5,000m of auger drill holes have also been sent for laboratory re-assay with results expected early in the second quarter. Ground based reconnaissance and gamma line surveys are now underway across the Sulista exploration project area to map the full extent of surface rare earth mineralisation.

End Notes

The information contained in this announcement relating to BRE's historical exploration results is extracted from, or was set out in, the following ASX announcements (Original ASX Announcements) which are available to view at BRE's website at www.brazilianrareearths.com:

- The Prospectus dated 13 November 2023 (refer ASX announcement dated 19 December 2023)
- ASX Announcements dated 22 January 2024 and 1 February 2024

BRE confirms that it is not aware of any new information or data that materially affects the information included in the Original ASX Announcements.

Cautionary Statement Portable Gamma Spectrometer Results

Gamma spectrometer results included in this report are preliminary. The use of 'point location' gamma readings only provide an indication of the presence of gamma releasing minerals such as monazite. The mineralisation that is the subject of this report will be submitted for laboratory assay to determine full suite TREO grades.

This announcement has been authorized for release by the CEO and Managing Director.

Forward-Looking Statements and Information

This Announcement may contain "forward-looking statements" and "forward-looking information", including statements and forecasts which include (without limitation) expectations regarding industry growth and other trend projections, forward-looking statements about the BRE's Projects, future strategies, results and outlook of BRE and the opportunities available to BRE. Often, but not always, forward-looking information can be identified by the use of words such as "plans", "expects", "is expected", "is expecting", "budget", "outlook", "scheduled", "target", "estimates", "forecasts", "intends", "anticipates", or "believes", or variations (including negative variations) of such words and phrases, or state that certain actions, events or results "may", "could", "would", "might", or "will" be taken, occur or be achieved. Such information is based on assumptions and judgments of BRE regarding future events and results. Readers are cautioned that forward-looking information involves known and unknown risks, uncertainties and other factors which may cause the actual results, targets, performance or achievements of BRE to be materially different from any future results, targets, performance or achievements expressed or implied by the forward-looking information.

Forward-looking statements are not guarantees of future performance and involve known and unknown risks, uncertainties, assumptions and other important factors, many of which are beyond the control of the Company, the Directors and management of the Company. Key risk factors associated with an investment in the Company are detailed in Section 3 of the Prospectus dated 13 November 2023. These and other factors could cause actual results to differ materially from those expressed in any forward-looking statements.

Forward-looking information and statements are (further to the above) based on the reasonable assumptions, estimates, analysis and opinions of BRE made in light of its perception of trends, current conditions and expected developments, as well as other factors that BRE believes to be relevant and reasonable in the circumstances at the date such statements are made, but which may prove to be incorrect. Although BRE believes that the assumptions and expectations reflected in such forward-looking statements and information (including as described in this Announcement) are reasonable, readers are cautioned that this is not exhaustive of all factors which may impact on the forward-looking information.

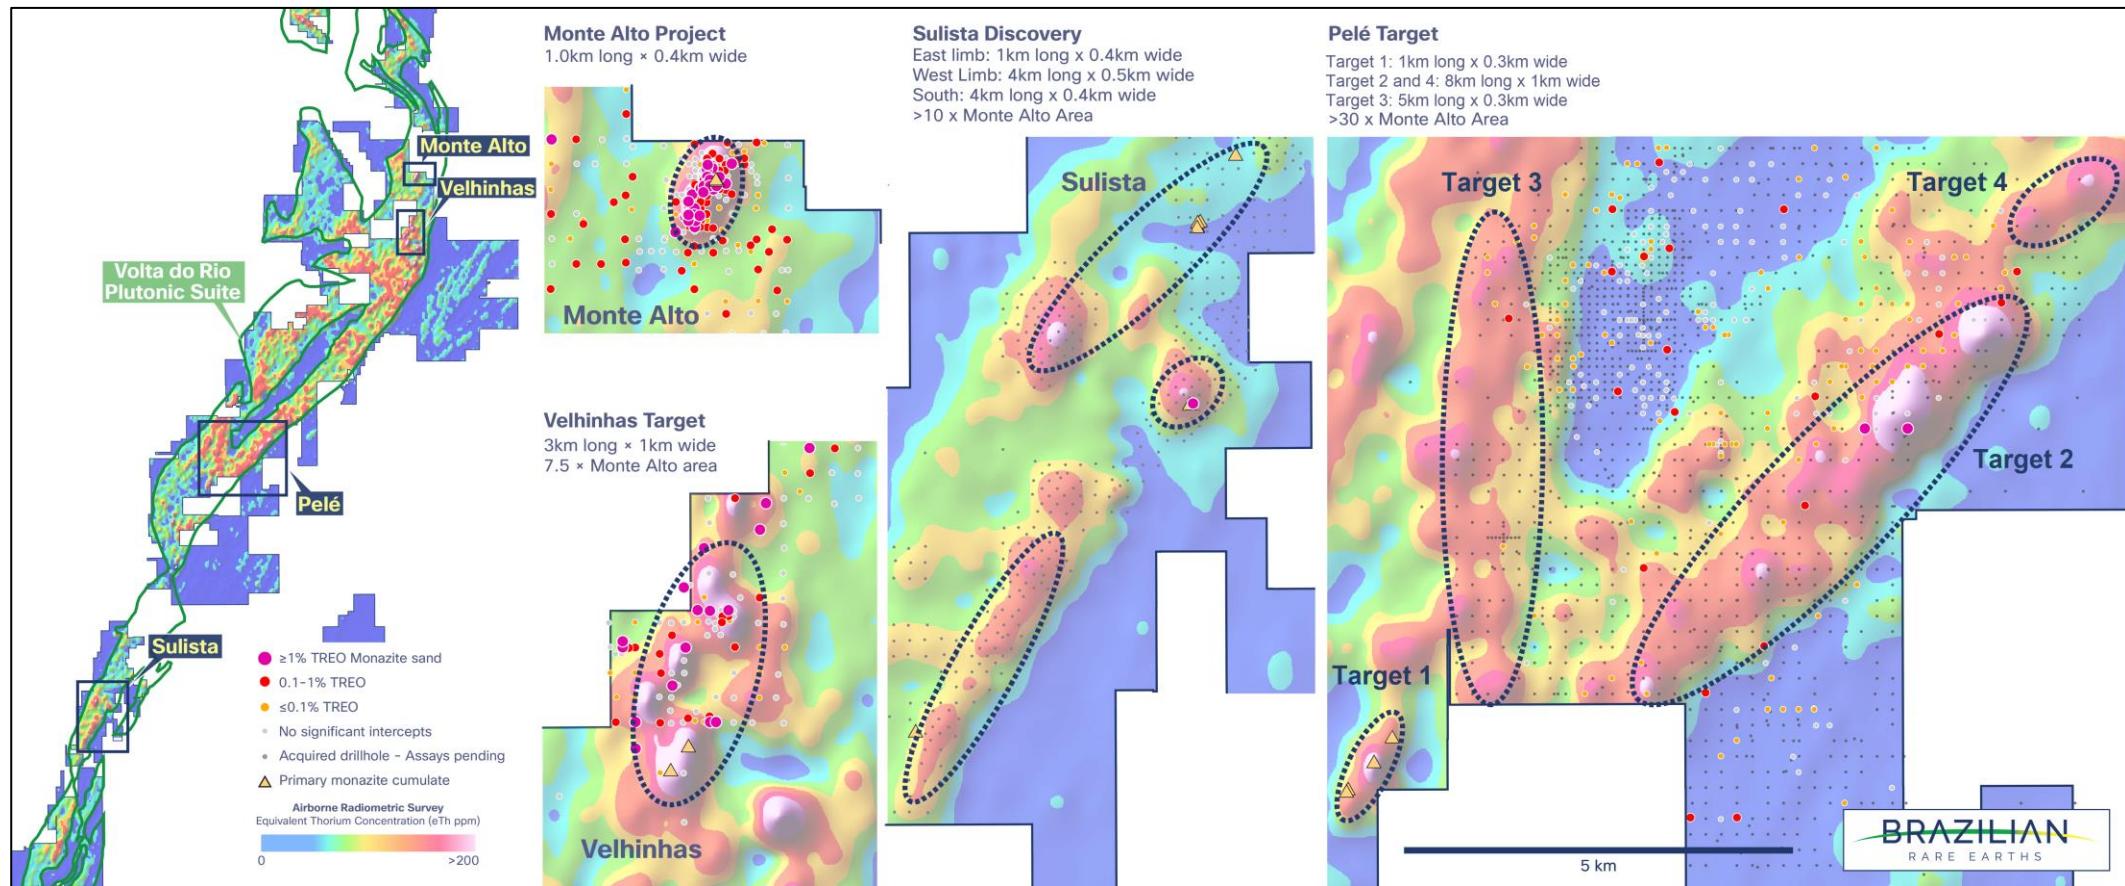

The Company cannot and does not give assurances that the results, performance or achievements expressed or implied in the forward-looking information or statements detailed in this Announcement will actually occur and prospective investors are cautioned not to place undue reliance on these forward-looking information or statements.

Forward looking statements in these materials speak only at the date of issue. Subject to any continuing obligations under applicable law or any relevant stock exchange listing rules, in providing this information the Company does not undertake any obligation to publicly update or revise any of the forward-looking statements or to advise of any change in events, conditions or circumstances on which any such statement is based.

Competent Persons Statement

The information in this announcement that relates to Exploration Results is based on, and fairly represents, information compiled or reviewed by Mr Adam Karst P.G, a Competent Person who is a registered member of the Society of Mining, Metallurgy and Exploration which is a Recognised Overseas Professional Organisation. Mr Karst has sufficient experience that is relevant to the style of mineralisation and types of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr. Karst consents to the inclusion in this report of the results of the matters based on his information in the form and context in which it appears.

APPENDIX F: JORC Table

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
<i>Sampling techniques</i>	<ul style="list-style-type: none"> • <i>Nature and quality of sampling (eg. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> • <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> • <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> • <i>In cases where 'industry standard' work has been done this would be relatively simple (eg. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg. submarine nodules) may warrant disclosure of detailed information.</i> 	<p>The reported results are obtained from auger and sonic drilling.</p> <p>Sonic core holes were drilled using 2m run lengths. Drill core was collected directly from a core barrel and placed in pre-labelled core trays. Run interval depths were measured and recorded. Drill core was transported to the BRE's exploration facility where it was measured for recovery, geologically logged, photographed, and marked up for sampling.</p> <p>Sonic drill core was cut with a knife, into two quarter core samples with one submitted for assay and the other retained for archive. The remaining half core remained in the core tray for further testing. Cuts were made along a line drawn to ensure samples were not influenced by the distribution of mineralization within the drill core (i.e. the cut line bisected mineralized zones). The split for assay was placed in pre-numbered sample bags for shipment to the laboratory for ICPMS analysis.</p> <p>Auger samples were recovered directly from the auger bucket and placed onto a polypropene tarp, photographed, and geologically logged in the field. The samples were transported to the BRE's exploration facility where they were sieved through a 10 mm by 10 mm screen. The oversized material was mechanically pulverized prior to being recombined with the undersized material on a plastic tarp. The sample was homogenised by working the material back and forth on tarp and was then split into two portions: one for assay and another for archive. The split for assay was placed in pre-numbered sample bags for shipment to the laboratory for ICPMS analysis. The other portion was bagged and stored onsite in a secure warehouse as archive material. The collected sample interval lengths are 1 m with some variation depending on sample recovery and geological unit boundaries.</p> <p>Grab samples were collected from REE-Nb-Sc boulders/corestones, subcrop and outcrop using a rock hammer to obtain representative rock fragments with an average weight of 0.6kg. Rock fragments were placed in pre-numbered sample bags in the field and then transported to the Company's exploration facility for shipment to the laboratory for ICPMS analysis.</p> <p>All drilling provided a continuous sample of mineralized zone. All mineralisation that is material to this report has been directly determined through quantitative laboratory analytical techniques that are detailed in the sections below.</p>

		<p>A panned concentrate was obtained from a regolith sample by obtaining a 0.4kg split, submerging in water and washing until the water runs clear. The material is manually agitated to remove lighter particles. Larger quartz grains are picked out, and iron rich minerals are removed using a magnet. The process resulted in a concentrate of approximately 40g, a mass reduction of 90%.</p>
Drilling techniques	<ul style="list-style-type: none"> • Drill type (eg. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<p>Sonic drilling was conducted by BRE using a Royal Eijkelkamp CompactRotoSonic XL170 MAX DUO rig to drill vertical holes with an operational depth limit of 200m and utilized a 2m long single wall barrel to obtain 0.076m diameter core, or a 2m long double wall core barrel to obtain 0.068m diameter core. The sonic drill string is advanced until either rock or hard boulders/corestones are encountered, or operational limits are reached. Outer casing is used when the water table or poor recovery is encountered. Water is used as a drilling fluid as necessary and to aid in extruding material from the core barrel. The sonic drill rig has a maximum operational depth limit of 60m. The average sonic hole depth is 35m. Sonic core is not oriented.</p> <p>Auger drilling was conducted by BRE using a 0.05m diameter x 0.4m long clay soil auger bucket with 0.5m to 1m long rods rotated by a gasoline engine with hand-holds. The auger bucket was advanced by adding rods until either groundwater was reached (which degrades sample quality) or refusal due to rock or hard saprolite. Auger drilling has a maximum operational limit of 30 m deep. The average auger hole depth is 18m. All auger holes are drilled vertically.</p>
Drill sample recovery	<ul style="list-style-type: none"> • Method of recording and assessing core and chip sample recoveries and results assessed. • Measures taken to maximise sample recovery and ensure representative nature of the samples. • Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>The sonic core was transported from the drill site to the logging facility in covered boxes with the utmost care. The recovered drill core was measured, and the length was divided by the interval drilled and expressed as a percentage. This recovery data was recorded in the database.</p> <p>Samples collected from auger drilling were checked by the technician at the rig to ensure they represented of the interval drilled. When fall-back was noted, fallen material was removed before sample collection. If poor recovery is encountered drill speed was decreased. If poor recovery at the beginning of a hole was persistent, the hole was redrilled at a nearby location. For sonic drilling, casing is used to minimize fall back.</p> <p>Recoveries for all core drilling are consistently good. There does not appear to be a relationship between sample recovery and grade or sample bias due to preferential loss or gain of fine or coarse material with these drilling and sampling methods.</p>
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate 	Data was collected in sufficient detail to support Mineral Resource estimation studies.

	<p><i>Mineral Resource estimation, mining studies and metallurgical studies.</i></p> <ul style="list-style-type: none"> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<p>Drill core was logged at BRE's exploration facility by the logging geologist. Sonic core was photographed wet in core boxes immediately before sampling.</p> <p>Each auger drillhole interval was logged in the field by the onsite technician. Each auger sample was arranged on a plastic sheet to align with the likely in-situ position and was then photographed in its natural condition prior to transport to the exploration facility. Photos show auger hole number and drill run lengths.</p> <p>Logging included qualitative determinations of primary and secondary lithology units, weathering profile unit (mottled zone, lateritic zone, saprock, saprolite, etc.) as well as colour and textural characteristics of the rock. Quantitative measurement of structural and geophysical features were also measured.</p> <p>GPS coordinates as well as geological logging data for all drillholes were captured in a Microsoft Excel spreadsheet and uploaded to the project database in MXDeposit.</p> <p>All drill holes reported in this news release were logged entirely.</p>
<i>Sub-sampling techniques and sample preparation</i>	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality, and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<p>Core from sonic drilling was split to obtain quarter core sub-samples for assaying. Reported diamond core sample intervals were typically 1m in length with a minimum of 0.6m and a maximum of 1.6m. Interval lengths considered lithological boundaries (i.e. sample was to, and not across, major contacts). To avoid selection bias, the right of core was consistently sampled, and the bottom half retained in the core tray for archiving.</p> <p>Each auger sample was sieved through a 10mm by 5mm screen. The oversized material mechanically pulverized prior to being re-combined with the undersized material on a plastic tarp. The sample material was homogenized by working it back and forth on the tarp, and then split using the cone and quarter method to produce sub-samples for assaying and archiving. Auger samples were processed with natural moisture content. Otherwise, samples too wet for effective screening were air dried naturally prior to processing. To minimize cross contamination sampling tools, such as the plastic tarp, screen, and cutting tools were cleaned using compressed air between samples. Initially, archived pulp and coarse reject material obtained by the previous operator was submitted for analysis without sub sampling. This methodology was later changed to include coarse reject material only with every fourth 0.5m sample collected starting at the bottom of the hole upward. Coarse reject material was submitted for analysis without sub-sampling.</p> <p>Field duplicates were completed at frequency 1:20 samples to evaluate the sample collection procedures to ensure representativeness and show good reproducibility. Duplicate analyses of coarse crush and pulp material were provided by SGS.</p> <p>Submitted samples of all types have appropriate mass to represent the material collected which includes mega-enclaves of monazite cumulate REE-Nb-Sc mineralization, microparticle to sand sized monazite grains, and ionic clay REE mineralisation.</p>

Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established. 	<p>This report contains assay data derived from BRE exploration and from re-assaying of pulp samples obtained by the previous operator.</p> <p>BRE Exploration:</p> <p>Drill core, auger and grab samples collected by the Company were assayed by SGS Geosol in Vespasiano, Minas Gerais, Brazil, which is considered the Primary laboratory.</p> <p>Samples were initially dried at 105 degrees Celsius for 24 hours. Samples were crushed to 75% passing the 3mm fraction and the weight was recorded. The sample was reduced on a rotary splitter and then 250g to 300g of the sample was pulverized to 95% passing 75 µm. Residues were stored for check analysis or further exploration purposes.</p> <p>The assay technique used for REE was Lithium Borate Fusion ICP-MS (SGS Geosol code IMS95A). This is a total analysis of the REE. Elements analysed at ppm levels were as follows:</p> <table border="1"> <tbody> <tr> <td>Ce</td> <td>Co</td> <td>Cs</td> <td>Cu</td> <td>Dy</td> <td>Er</td> <td>Eu</td> <td>Ga</td> </tr> <tr> <td>Gd</td> <td>Hf</td> <td>Ho</td> <td>La</td> <td>Lu</td> <td>Mo</td> <td>Nb</td> <td>Nd</td> </tr> <tr> <td>Ni</td> <td>Pr</td> <td>Rb</td> <td>Sm</td> <td>Sn</td> <td>Ta</td> <td>Tb</td> <td>Th</td> </tr> <tr> <td>Tl</td> <td>Tm</td> <td>U</td> <td>W</td> <td>Y</td> <td>Yb</td> <td></td> <td></td> </tr> </tbody> </table> <p>Overlimit samples were analysed at percentage levels using SGS Geosol analysis code IMS95RS</p> <p>The assay technique used for major oxides and components was Lithium Borate Fusion ICP-OES (SGS Geosol code ICP95A). This is a total analysis for the elements analysed % and ppm (Ba, V, Sr, Zn, Zr) levels as listed below:</p> <table border="1"> <tbody> <tr> <td>Al₂O₃</td> <td>Ba</td> <td>CaO</td> <td>Cr₂O₃</td> </tr> <tr> <td>Fe₂O₃</td> <td>K₂O</td> <td>MgO</td> <td>MnO</td> </tr> <tr> <td>Na₂O</td> <td>P₂O₅</td> <td>SiO₂</td> <td>Sr</td> </tr> <tr> <td>TiO₂</td> <td>V</td> <td>Zn</td> <td>Zr</td> </tr> </tbody> </table> <p>Analysis for Scandium (Sc) was made by 4-Acid ICP-AES Analysis (SGS Geosol code ICM40-FR).</p> <p>Re-assay Program:</p> <p>Archived pulp and coarse reject samples obtained by the previous operator were submitted for preparation at ALS Belo Horizonte, Brazil and assayed by ALS Lima, Peru.</p>	Ce	Co	Cs	Cu	Dy	Er	Eu	Ga	Gd	Hf	Ho	La	Lu	Mo	Nb	Nd	Ni	Pr	Rb	Sm	Sn	Ta	Tb	Th	Tl	Tm	U	W	Y	Yb			Al ₂ O ₃	Ba	CaO	Cr ₂ O ₃	Fe ₂ O ₃	K ₂ O	MgO	MnO	Na ₂ O	P ₂ O ₅	SiO ₂	Sr	TiO ₂	V	Zn	Zr
Ce	Co	Cs	Cu	Dy	Er	Eu	Ga																																											
Gd	Hf	Ho	La	Lu	Mo	Nb	Nd

Al ₂ O ₃	Ba	CaO	Cr ₂ O ₃																																															
Fe ₂ O ₃	K ₂ O	MgO	MnO																																															
Na ₂ O	P ₂ O ₅	SiO ₂	Sr																																															
TiO ₂	V	Zn	Zr																																															

		<p>Samples were prepared in the same manner as at SGS with the exception that 250g to 300g of the sample was pulverized to 85% passing 75 µm. Residues were stored for check analysis or further exploration purposes.</p> <p>The assay technique used for REE was Lithium Borate Fusion ICP-MS (ALS code ME-MS81) with appropriate overlimit analyses. This is a total analysis of the REE. Elements analysed at ppm levels were as at SGS.</p> <p>At both laboratories, accuracy was monitored through submission of certified reference materials (CRMs) supplied by OREAS North America Inc. CRM materials (25a, 106, 147, 460 and 465) cover a range of REE grades encountered on the project. CRM 465 has an equivalent grade of approximately 10% TREO and supports reliable analysis of high grade REEE-Nb-Sc mineralization detailed in this report. CRM were inserted within batches of core, sonic and auger drill samples, and grab samples, at a frequency of 1:20 samples.</p> <p>CRMs were submitted as “blind” control samples not identifiable by the laboratory and were alternated to span the range of expected grades within a group of 100 samples.</p> <p>Contamination was monitored by insertion of blank samples of coarse quartz fragments. Blanks were inserted within batches of sonic and auger drill samples, and grab samples, at a frequency of 1:40 samples. Blanks pass through the entire sample preparation stream to test for cross contamination at each stage. No laboratory contamination or bias were noticed.</p> <p>Precision and sampling variance was monitored by the collection ‘Field duplicate’ samples, predominantly from mineralised intervals, at the rate of 1:20 samples. Half core was split into two ¼ core samples to make field duplicate pairs that are analysed sequentially.</p> <p>The adopted QA/QC protocols are acceptable for this stage of exploration. Examination of the QA/QC sample data indicates satisfactory performance of field sampling protocols and assay laboratory procedures. Levels of precision and accuracy are sufficient to allow disclosure of analysis results and their use for Mineral Resource estimation.</p>
Verification of sampling and assaying	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<p>No independent verification of significant intersections was undertaken.</p> <p>Nineteen closely spaced twin holes were drilled using a sonic drill rig to verify the auger drilling and sampling methods. There does not appear to be a systematic bias associated with auger drill method. Mean assay values obtained by augering are not likely to be higher or lower than values obtained by sonic drilling.</p> <p>All assay results are checked by the company’s Principal Geologist. Logging for drillholes was directly uploaded to the project database housed in the MXDeposit system. Assay data and certificates in digital format from the laboratory are directly uploaded to the project database.</p>

Rare earth oxide is the industry-accepted form for reporting rare earth elements. The following calculations are used for compiling REO into their reporting and evaluation groups:

Note that Y_2O_3 is included in the TREO, HREO and MREO calculations.

TREO (Total Rare Earth Oxide) = $\text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Y}_2\text{O}_3 + \text{Lu}_2\text{O}_3$

HREO (Heavy Rare Earth Oxide) = $\text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Y}_2\text{O}_3 + \text{Lu}_2\text{O}_3$

MREO (Magnet Rare Earth Oxide) = $\text{Nd}_2\text{O}_3 + \text{Pr}_6\text{O}_{11}\text{Pr}_6\text{O}_{11} + \text{Tb}_4\text{O}_7 + \text{Dy}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Y}_2\text{O}_3$

LREO (Light Rare Earth Oxide) = $\text{La}_2\text{O}_3 + \text{CeO}_2 + \text{Pr}_6\text{O}_{11} + \text{Nd}_2\text{O}_3$.

NdPr = $\text{Nd}_2\text{O}_3 + \text{Pr}_6\text{O}_{11}$

NdPr % of TREO = $\text{Nd}_2\text{O}_3 + \text{Pr}_6\text{O}_{11}/\text{TREO} \times 100$

HREO % of TREO = $\text{HREO}/\text{TREO} \times 100$

Conversion of elemental analysis (REE) to stoichiometric oxide (REO) was undertaken by spreadsheet using defined conversion factors.

<i>Element</i>	<i>Factor</i>	<i>Oxide</i>
<i>La</i>	1.1728	<i>La</i> ₂ O ₃
<i>Ce</i>	1.2284	<i>Ce</i> ₂ O ₃
<i>Pr</i>	1.2082	<i>Pr</i> ₆ O ₁₁
<i>Nd</i>	1.1664	<i>Nd</i> ₂ O ₃
<i>Sm</i>	1.1596	<i>Sm</i> ₂ O ₃
<i>Eu</i>	1.1579	<i>Eu</i> ₂ O ₃
<i>Gd</i>	1.1526	<i>Gd</i> ₂ O ₃
<i>Tb</i>	1.1762	<i>Tb</i> ₄ O ₇
<i>Dy</i>	1.1477	<i>Dy</i> ₂ O ₃
<i>Ho</i>	1.1455	<i>Ho</i> ₂ O ₃
<i>Er</i>	1.1435	<i>Er</i> ₂ O ₃
<i>Tm</i>	1.1421	<i>Tm</i> ₂ O ₃
<i>Yb</i>	1.1387	<i>Yb</i> ₂ O ₃
<i>Lu</i>	1.1372	<i>Lu</i> ₂ O ₃

		<i>Y</i>	1.2699	Y_2O_3
<i>Location of data points</i>	<ul style="list-style-type: none"> <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> <i>Specification of the grid system used.</i> <i>Quality and adequacy of topographic control.</i> 	<p>The process of converting elemental analysis of rare earth elements (REE) to stoichiometric oxide (REO) was carried out using predefined conversion factors on a spreadsheet. (Source:https://www.jcu.edu.au/advanced-analytical-centre/services-and-resources/resources-and-extras/element-to-stoichiometric-oxide-conversion-factors)</p>		
<i>Data spacing and distribution</i>	<ul style="list-style-type: none"> <i>Data spacing for reporting of Exploration Results.</i> <i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> <i>Whether sample compositing has been applied.</i> 	<p>Sonic drill collars are located by a surveyor using RTK-GPS with centimetre scale accuracy. Auger drill hole collars and grab sample sites were located by a handheld GPS with accuracies <5m. Downhole surveys are not collected for sonic and auger drill holes which are vertical and less than 30m (auger) or 60m (sonic). Therefore, drill hole deviation will result in errors that are not material to the reliability of drillhole trace projections.</p> <p>The accuracy of projected exploration data locations is sufficient for this stage of exploration and to support mineral resource estimation studies.</p> <p>The gird datum used is SIRGAS 2000 UTM 24S. Topographic control is provided by a DEM obtained from SRTM data at a lateral resolution of 30m².</p>		
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<p>At all target areas laterally extensive REE enriched horizons are present in the regolith. These areas are tested by the Company using auger and sonic drilling at spacings ranging from approximately 80m to 400m in the north-south and east west directions. At Monte Alto, REE are predominantly hosted in the regolith by sand sized monazite grains distributed within a central high-grade zone. This zone is tested by auger and sonic drilling at 80 m grid spacings. For all regolith mineralisation styles, the drill spacing is sufficient to establish geology and grade continuity in accordance with Inferred classification criteria.</p> <p>Composite sample grades are calculated by generating length weighted averages of assay values.</p>		

Sample security	<ul style="list-style-type: none"> • <i>The measures taken to ensure sample security.</i> 	<p>After collection in the field, the auger and grab samples were placed in sealed plastic bags that were then placed into larger polyweave bags labelled with the sample IDs inside and transported to the Company's secure warehouse. Drill core samples were transported in their core boxes.</p> <p>A local courier transported the samples submitted for analysis to the laboratory. A copy of all waybills related to the sample forwarding was secured from the expeditor.</p> <p>An electronic copy of each submission was forwarded to the laboratory to inform them of the incoming sample shipment.</p> <p>Once the samples arrived at the laboratory, the Company was notified by the laboratory manager and any non-compliance is reported.</p> <p>The laboratory did not report any issues related to the samples received.</p>
Audits or reviews	<ul style="list-style-type: none"> • <i>The results of any audits or reviews of sampling techniques and data.</i> 	<p>The Company engaged the services of Telemark Geosciences to review the sampling and analysis techniques used at the Project, and to establish a "Standard Operating Procedures" manual to guide exploration.</p> <p>CSA Global Associate Principal Consultant, Peter Siegfried has toured the Company's exploration sites and facilities and conducted reviews of sampling techniques and data. The Company has addressed recommendations and feedback provided by CSA Global.</p>

Section 2: Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> • Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. • The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<p>The Project is 100% owned by, or to be acquired by, subsidiaries of Brazilian Rare Earths Limited (BRE), an Australian registered company.</p> <p>Located in the State of Bahia, Northeastern Brazil, the BRE Property consists of 120 granted exploration permits covering a land area of approximately 1,683 km². The Sulista Rare Earth Property comprises 11 (eleven) granted exploration permits covering a land area of approximately 108 km². Permits are registered at Brazil's National Mining Agency</p> <p>The Project also includes additional applications for over 2,592 km² of exploration licenses, four applications for mining permits and two disponibilidades, as well as an option (described in the prospectus as the Amargosa Option Agreement) to acquire three additional granted exploration permits.</p> <p>All exploration permits are held by the Company's Brazilian subsidiaries directly or are to be acquired through agreements with third parties as detailed in the BRE prospectus and in the Company's ASX Announcement "BRE Expands Control over Rocha da Rocha Rare Earth Province" dated January 22, 2024</p> <p>All mining permits in Brazil are subject to state and landowner royalties, pursuant to article 20, § 1, of the Constitution and article 11, "b", of the Mining Code. In Brazil, the Financial Compensation for the Exploration of Mineral Resources (Compensação Financeira por Exploração Mineral - CFEM) is a royalty to be paid to the Federal Government at rates that can vary from 1% up to 3.5%, depending on the substance. It is worth noting that CFEM rates for mining rare earth elements are 2%. CFEM shall be paid (i) on the first sale of the mineral product; or (ii) when there is mineralogical mischaracterization or in the industrialization of the substance, which is which is considered "consume" of the product by the holder of the mining tenement; or (iii) when the products are exported, whichever occurs first. The basis for calculating the CFEM will vary depending on the event that causes the payment of the royalty. The landowners' royalties could be subject of a transaction, however, if there's no agreement to access the land or the contract does not specify the royalties, article 11, §1, of the Mining Code sets forth that the royalties will correspond to half of the amounts paid as CFEM. The exploration tenement (870.685/2021) that host the Monte Alto project that is the subject of this report is subject to an additional 2.5% royalty agreement in favour of Brazil Royalty Corp. Participações e Investimentos Ltda (BRRCP).</p> <p>The portion of exploration tenement (870.685/2021) that hosts the Monte Alto Deposit that is the subject of this report measures 53.26 km² and is not known to within any environmentally designated areas. The remainder of the tenement, measuring 84.17 km²,</p>

		<p>falls within a State Nature Reserve (APA Caminhos Ecológicos da Boa Esperança), in which mining activities are allowed if authorized by the local environmental agency.</p> <p>The tenements are secure and in good standing with no known impediments to obtaining a licence to operate in the area.</p>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<p>On the BRE Property, no previous exploration programs conducted by other parties for REEs.</p> <p>Between 2007 and 2011 other parties conducted exploration that is detailed in the company's prospectus and included exploratory auger drilling. The previous operator collected auger drill samples using a comparable method to the Company but using 0.5 m intervals. Auger holes were 12 m deep on average with a maximum depth of approximately 30 m. Auger drilling was completed by the previous operator at 200 to 800m spacings in areas prospective for REE mineralization, decreasing to 100m in areas prospective for bauxite mineralization. The location of drill holes competed by the previous operator were surveyed by professional surveyors using high precision geodetic GNSS or electronic total station equipment with centimetric accuracy. Samples obtained by the previous operator have been stored in a secure facility. The drilling conducted by the previous operator has been appraised as suitable to support the findings in this report.</p> <p>On the Sulista Property, between 2013 and 2019 the project Vendors conducted exploration on the Licences that included drilling of approximately 5,000m of across 499 auger holes and approximately 1,000m of core holes. As of the effective date of this report, BRE is appraising the exploration data collected by the previous operator at the Sulista property.</p>
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<p>The Company's tenements contain REE deposits interpreted as analogies to Ion Adsorption ionic Clay ("IAC") deposits, and regolith hosted deposits of monazite mineral grains, and primary in-situ REEE-Nb-Sc mineralisation.</p> <p>The Project is hosted by the Jequié Complex, a terrain of the north-eastern São Francisco Craton, that includes the Volta do Rio Plutonic Suite of high-K ferroan ("A-type") granitoids, subordinate mafic to intermediate rocks; and thorium rich monazitic granite gneiss with associated REE. The region is affected by intense NE-SW regional shearing which may be associated with a REE enriched hydrothermal system.</p> <p>Exploration completed by the Company has focused on the bedrock and regolith profile.</p> <p>Bedrock mineralization is characterized by steeply dipping to sub vertical mega-enclaves of REE-Nb-Sc monazite cumulate mineralization. Local bedrock controls to mineralisation, such as faults or dykes, are not well understood. The company has initiated mapping of the limited bedrock exposures at property and proposes to undertake deeper drilling to create a model of the local geological setting.</p> <p>The regolith mineralization is characterised by a REE enriched lateritic zone at surface underlain by a depleted mottled zone grading into a zone of REE-accumulation in the saprolite part of the profile.</p>

Drill hole Information	<ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> ◦ easting and northing of the drill hole collar ◦ elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar ◦ dip and azimuth of the hole ◦ down hole length and interception depth ◦ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<p>The details related to all the auger drill holes presented in this Report are detailed in Appendix B and C.</p>
Data aggregation methods	<ul style="list-style-type: none"> • In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<p>Downhole length weighted averaging is used to aggregate assay data from multiple samples within a reported intercept. No grade truncations or cut-off grades were applied. No metal equivalents values are used.</p>
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> • These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg. 'down hole length, true width not known'). 	<p>In the weathered profile all intercepts reported are down hole lengths. The geometry of mineralisation is interpreted to be flat. The drilling is vertical and perpendicular to mineralisation. In the weathered profile down hole lengths correspond to true widths. Significant results in Appendix B and C are reported using both down hole values.</p>
Diagrams	<ul style="list-style-type: none"> • Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<p>Diagrams, tables, and any graphic visualization are presented in the body of the report.</p>
Balanced reporting	<ul style="list-style-type: none"> • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced avoiding misleading reporting of Exploration Results. 	<p>The report presents all drilling results that are material to the project and are consistent with the JORC guidelines. Where data may have been excluded, it is considered not material.</p>
Other substantive	<ul style="list-style-type: none"> • Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of 	<p>Detailed walking radiometer surveys have been completed on the target areas using a RS-230 Portable Gamma Spectrometer. In survey mode, the total Count of gamma particles Per Second ("CPS") is recorded in real time.</p>

exploration data	<p><i>treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></p>	<p>In survey mode, the total count of radioactive elements is recorded in real time. Readings are taken at waist height (approximately 1 m from the surface), the sensor can capture values in a radius of up to 1 m².</p> <p>High CPS occur in the presence of gamma releasing minerals. Throughout the Rocha da Rocha Critical Mineral Province, BRE has observed a positive correlation between CPS and thorium and REE bearing monazite. BRE has determined that gamma spectrometry is an effective method for determining the presence of REE mineralization that is material to this report</p>
Further work	<ul style="list-style-type: none"> • <i>The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> • <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> 	<p>To further develop the Monte Alto target and develop a hard-rock REE-Nb-Sc Mineral Resource, the Company will complete additional step-out and infill diamond core drilling to establish geological and grade continuity aiming for a drill spacing of 40 m x 40 m at the Monte Alto deposit.</p> <p>Elsewhere on the project BRE intends to test the Regolith Exploration Target (effective date of July 1, 2023) which is based on the results of BRE's previous drill programs and will be tested by ongoing infill and step out auger drilling in high priority areas.</p> <p>Upcoming works aim to validate the historic drilling and assess whether or not the project may become economically feasible including metallurgical recovery, process flowsheet and optimisation. Further resource definition through additional drilling and sampling, geological mapping, and regional exploration through additional land acquisition are also planned. No forecast is made of such matters.</p>
