Theta Gold Mines Limited (TGMGF-OTCQB)

Zacks Initiates Coverage of Theta Gold Mines

Based on a calculation of fully diluted share value of attributable resources, which uses the most recent financial statements and studies/reports on the company's projects, a target of US\$0.60 per share is indicated.

Current Price (11/09/20) \$0.25
Valuation \$0.60

OUTLOOK

Theta Gold Mines is **on the verge of transitioning** from a junior exploration company to a **gold producer**. By targeting high-grade, near-surface gold deposits in the brownfield Pilgrims Rest and Sabie Gold Fields in South Africa, management plans to **employ modern mining and gold processing techniques** to produce over 225,000 oz. Au during **Phase 1** of management's **4 Mine Strategy**. Furthermore, through multiple exploration campaigns, the company's total **Mineral Resources has increased by over 100%** over the last four years. A surface mining permit is in the final stage of review and is expected to be granted before the end of the year.

KEY POINTS

- Theta Gold Mines (OTCQB: TGMGF, ASX: TGM) is a junior gold development company **on the threshold of becoming a gold producer**.
- The company holds mining rights encompassing **62,000 hectares** (620 km²) situated in the **Eastern Transvaal Gold Fields** of northeastern **South Africa** that contain more than 40 historical mines.
- Management is implementing a **4 Mine Strategy** in order to monetize 2.75 million ounces of gold
 - **Phase 1** targets shallow, **near-surface, high-grade gold reef deposits** around Theta Hill (in MR83), which is within 3km of the existing, fully permitted processing plant
 - **Scoping Study** completed
 - **Feasibility Study** completed
 - Estimated **gold recovery** of **234,063 oz. Au**
 - At gold price of \$1,600,
 - estimated **IRR of 157%**
 - **payback period** - only 6 months
 - **Phase 2** also targets shallow, near-surface deposits that are continuations of the mineralized reefs of Phase 1 that extend into another mineral right (MR 341)
 - **Scoping Study** completed
 - Estimated **resource of 500,000 oz. Au**
 - Drilling programs planned to upgrade and expand resource
 - **Phase 3** is the project to mine the **underground** resource at the **Rietfontein Mine** (MR358 and MR10161)
 - **Scoping Study** completed with est. **resource of 779,800 oz. Au** (8.42 g/t)
 - **Phase 4** consists of mining the **underground** mineral resource at the **Beta Mine** (MR83)
 - **Scoping Study** completed with est. **resource of 1.003 million oz. Au** (6.75 g/t)
- Theta Gold Mines owns an existing **CIL processing plant** with a 2.5 million-tonne **tailings storage facility**
 - Within the last year, a **ball mill** was acquired and delivered to the plant site. Management plans to upgrade its current nameplate capacity (820,000tpa) by adding a crusher. By reducing the feed size, throughput is expected to increase to **1.2 MMtpa**.
 - In January 2020, an optimized plant study was completed raising the planned operating capacity to 600,000tpa.
 - Management expects to secure the financing to refurbish and upgrade the CIL processing plant by year end.
- The estimate of total (Measured, Indicated and Inferred) mineral resources has been upgraded five times since 2017 from 2.99 million to 6.03 million oz. Au.
 - An innovative application of resource-type specific **3-D electronic geological models** helped upgrade the estimate for total Mineral Resources by 38% in April 2018
 - Multiple **drilling campaigns** have driven the other increases in total resources
- Theta Gold Mines continues to explore the reef systems in several brownfield gold mines utilizing modern techniques.
 - In February 2020, a new **gold mineralization system model** was developed by CSA Global Consultants. The improved understanding of the mineralization will greatly aid in the determination of future drilling targets
- We expect the stock of Theta Gold Mines to react to upcoming announcements concerning the permit for surface mining on MR83, financing for refurbishing the CIL processing plant and the commencement of mining operations.
 - Also expected is news flow concerning the advancement of:
 - Phase 2 - drilling program to expand resource
 - Phase 3 – results of underground exploration program at Rietfontein Mine
- Management expects to be pouring gold by the end of 2021.

OVERVIEW

Headquartered in Sydney, Australia, Theta Gold Mines Limited (OTCQB: TGMGF, ASX: TGM) is a junior gold development company **on the verge of transitioning to a gold producer**. The company controls a highly prospective area of **62,000 hectares** (620 km²) situated in the **Eastern Transvaal Gold Fields** of northeastern **South Africa** through its 74% ownership of Transvaal Gold Mining Estate Limited (TGME). Founded in 1895, TGME is first gold mining company incorporated in South Africa and holds nine mineral mining tenements in the **Pilgrims Rest Gold Field**, along with tenements in the **Sabie Gold Field**, both of which encompass more than 40 historical mines in the area.

Theta Gold Mines Presentation February 2020

The intent behind management's 4 Mine Strategy is to develop two historically productive goldfields in the Eastern Transvaal Goldfield, the Pilgrims Rest Gold Field and the Sabie Gold Field. Management's development plan differs from prior attempts. Management's method is strongly based on the **optimization** of the project, not only with respect to initially **targeting higher-grade near-surface deposits**, but also by **optimizing the methods of both mining and processing**.

New Initiatives

Theta Gold Mines (formerly known as Stonewall Resources) acquired the TGME and Sabie Mines properties in 2010 and proceeded to develop them. After a brief period of extract gold from tailings dams, dumps and reef residue material from 2011 to 2014, there were conventional efforts to revive the Rietfontein Mine. In 2018, with a new management team led by Bill Guy, several innovative initiatives point to success for the current development plan.

- **Modern mining techniques** are going to be employed during the implementation of the 4 Mine Plan in order to deal with the challenges of extracting gold ore from the reef systems present in the Pilgrim's Rest and Sabie Gold Fields. Management talent with specific expertise in pursuing reefs has been brought on board to help execute management's strategy
- The **speed of progress** is impressive with 24 press releases having been issued since May 2018 that detail the progress being made towards initiating production
- The company is at the brink of being granted an Environmental Assessment, which opens the door to the immediate commencement of surface mining on MR 83
- In addition, the exploration campaigns since 2013 have **increased total Mineral Reserves by over 100%** (see Mineral Reserve section)

- The company is **building a new, modern CIL (Carbon-in-Leach) plant** on the existing permitted footprint of the old plant, together with the planned refurbishment of the old processing mill includes the **implementation of modern gold processing techniques** to deal with the metallurgical challenges posed by the nature of sulfide ore in order to maximize gold recovery
- A new geological model was developed in February 2020 that better explains the origin of the gold deposit that should enhance the effectiveness of exploratory efforts in the future.

Equity Developments

Nov. 2018	Consolidation of shares on a 10:1 basis
Nov. 2019	TGMGF listed on OTCQB market
July 2020	Theta Gold Mines Limited (OTCQB: TGMGF) became DTC eligible

In November 2019, the company's shares were admitted to the OTCQB market under ticker TGMGF. The company's primary listing is on the Australian Securities Exchange under the ticker TGM. In July 2020, TGMGF became DTC eligible, which facilitates electronic trading of the stock, particularly by individual investors.

GEOLOGY OF EASTERN TRANSVAAL GOLD FIELDS

The **Transvaal Basin** is a large original basin, which consists of a succession of sedimentary rock depositions, roughly 12km in thickness. During the Neo-Proterozoic era, the intrusive **Bushveld Complex** (the main source of gold-bearing fluids) was emplaced within the sedimentary rocks of the Transvaal Basin resulting in epigenetic mineral deposits. The Bushveld Complex is the largest (67,000 km² or 25,900 sq. miles) layered igneous intrusion on the Earth's crust. The large, saucer-shaped Bushveld Complex hosts the world's greatest resources of platinum group metals (PGM).

The Mining Rights held by Theta Gold Mines are located within the Pilgrim's Rest and Sabie Gold Fields, which are situated within the **Eastern Transvaal Gold Fields**, which are spatially related to the igneous Bushveld Complex. Several other small epigenetic gold deposits have been discovered in the eastern Transvaal Basin; however, the significant mineralization in the restricted area of Pilgrim's Rest and Sabie is believed to a result of the pressure, heat and transportation of acidic mineralized fluids emanating from the emplacement of the eastern limb of the Bushveld Complex.

Gold Mineralization System Model (CSA Global Consultants)

Theta Gold Mines Presentation February 2020

The gold mineralization found on Theta's properties display the characteristics of a **Carlin-type deposit**, namely epigenetic, sediment-hosted disseminated gold deposits grading between 1 to 20 g/t. Gold may occur in several forms, including free gold or gold telluride or may be associated with quartz veining. Due to the availability of economic concentrations of gold, Carlin-type deposits have been mined from both open pit and underground operations depending on the depth of the mineralization.

The sub-surface gold mineralization discovered in the Eastern Transvaal Gold Fields occurs as concordant and discordant reefs (veins), which have a NNE-SSW strike within host sediments of the Pretoria and Chuniespoort Groups in the Transvaal Supergroup (a South African stratigraphic term that refers to all rocks formed in the Transvaal Sedimentary Basin approximately 2.2 billion years ago). These **relatively flat-lying, gold-bearing reef systems** (dipping gently between 2° to 7° to the west) occur in different stratigraphic horizons within the sedimentary host rocks. **The most prolific recoveries have come from concordant bedding parallel reef horizons** comprised of narrow quartz-carbonate or quartz-sulfide veins. Such mineralized zones are usually are formed by an over-pressured fluid system, which is consistent with the Bushveld Complex emplacement theory.

Schematic of Reef System in Pilgrim's Rest and Sabie Gold Fields

LOCATION AND MINING RIGHTS

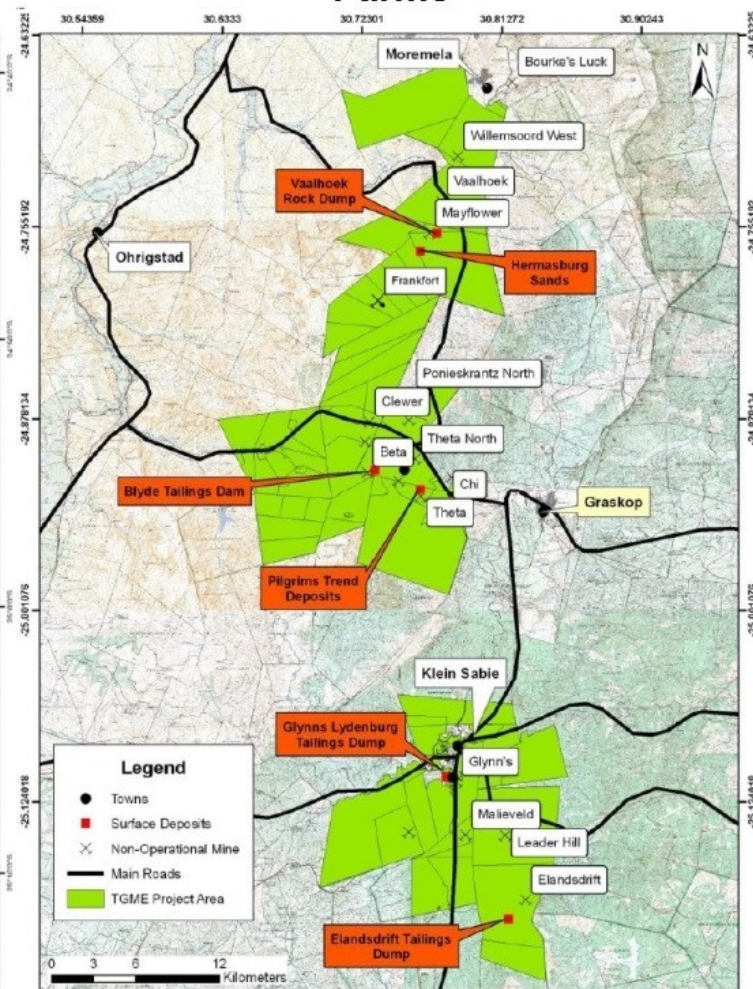

The gold mineralization tenements of Theta Gold Mines are located approximately 370 km northeast of Johannesburg in the vicinity of the towns of Pilgrim's Rest and Sabie. The Project area consists of **two blocks of contiguous tenements** that extend roughly 65 km in a north-south direction and 25 km east-west.

Mining Rights

Theta Gold Mines Presentation October 2020

Farms

Theta Gold Mines (formerly Stonewall Mining) Competent Persons' Report April 2012

The block surrounding **Pilgrim's Rest** consists of **five mining rights** (north-to-south MR10167, MR340, MR83, MR330 and MR341). Often referred to as the **Northern and Central areas**, the most prodigious historical mines (each milling over 1,000,000 tonnes of ore) were Dukes-Clewer (1.79 MM tonnes of ore milled), Theta (1.68 MM), Vaalhoek (1.3 MM) and Columbia Hill (1.028 MM) mines.

The block surrounding **Sabie** consists of **four mining rights** (north-to-south MR10161, MR358, MR433 and MR198). Dubbed the **Southern section**, it is composed of the assets of Glynn's Lydenburg Ltd, which was acquired by TGME in 1955). Between 1895 and 1955, the Southern section (under the control of Glynn's Lydenburg Ltd) milled 3,428,000 tons and produced 1.241 million ounces of gold.ⁱ The historic **Rietfontein mine**, which milled 227K tons of ore that produced 65K oz. of gold and 36K oz. of silver, is the resource target for **Phase 3** of management's 4 Mines Strategy.

4 MINE STRATEGY

Management is implementing a **4 Mine Strategy** in order to monetize 2.75 million ounces of gold **over five years**. A methodical 4 phase program has been developed, where each phase focuses on the mining of specific gold deposits in the Pilgrim's Rest and Sabie Gold Fields. In the process, the company is expected to create a platform with a production profile of 160,000 ounces per annum, which could monetize the other deposits, particularly additional open pit opportunities and Glynn's Lydenburg mine.

(MR83)

Theta Gold Mines Presentation October 2020

Phase 1 targets shallow, **near-surface deposits** in MR83 (Theta Hill, Browns Hill and Columbia Hill) that are very close (within 3km) of the existing, fully permitted processing plant. Known as the **Theta Open Pit Starter Project**, it includes rehabilitating the existing CIL plant and expanding its annual processing capacity to 600,000 tonnes. Management expects to be pouring gold by end of 2021.

Phase 2, or the **Theta Open-Pit Extension Project**, also targets shallow, **near-surface deposits** that are continuations of the mineralized reefs of the Theta Hill and Browns Hill systems that extend into MR 341.

Phase 3 targets shallow, underground gold deposits at the **Rietfontein underground** mine (MR358 and MR10161), approximately 40 km south of the processing plant.

Phase 4 targets shallow, underground gold deposits at the **Beta underground** mine in MR83.

In March 2018, Bill Guy joined the Theta Gold Mining (then known as Stonewall Resources) as a Director, and was appointed Chairman of the Board in September that year. At the time, the company's strategic business plan had been shifted so that in the near-term, Theta Gold Mines would first mine and process shallow, near-surface projects to demonstrate the economic viability of the company's South African properties (Phases 1 & 2) and also to help fund the advancement of the Rietfontein and Beta mine toward production.

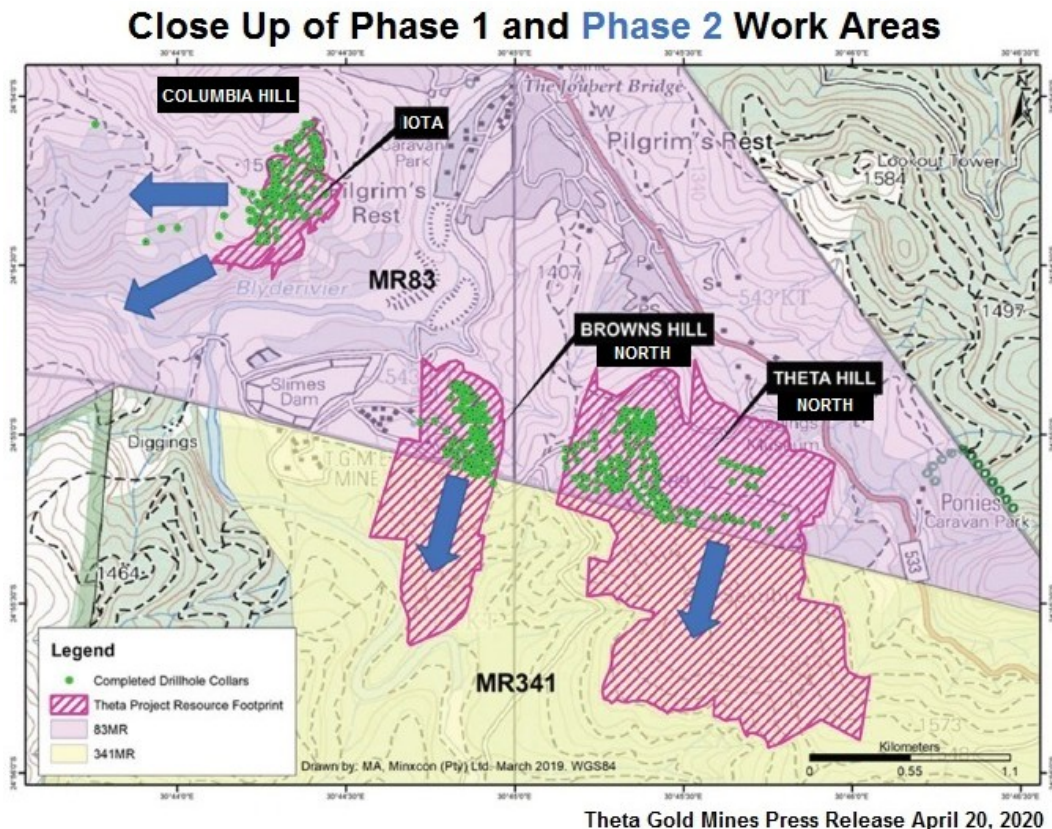

The objective of Phase 1 is to mine and process the near-surface reef deposits in MR83 near the processing plant. **Management plans to attain a production profile of 40,000 ounces per year during Phase 1** and expand it to greater than 80,000 ounces per annum during Phase 2 when the near-surface deposits that extend into MR341 are mined. Eventually, **in Phase 4, management anticipates that the annual production profile will reach 160,000 ounces.**

Also, the mineral resources being targeted in each successive phase increases in size. In **Phase 1**, according to the mine plan, the expected production is **234,063 ounces** of gold; the estimate for **Phase 2** is approximately **500,000 ounces**. The estimates for the Rietfontein and Beta Mines have not yet been put forward. Further exploration is expected to increase the mineral resources at both mines. However, utilizing the currently available resource estimation reports announced in May 2017, Rietfontein Mine's Indicated and Inferred mineral resource is 779,800 ounces (average grade 8.42 g/t), of which 242,200 ounces are in the Indicated category. The Beta Mine's Measured, Indicated and Inferred mineral resource is 1,086,000 ounces Au (average grade 6.1 g/t).

Theta Gold Mines Ltd				
Phase	Mine Targets	Mining Right	Type of Mining	Est. Ounces to be Recovered

Phase 2	Theta, Browns Hill	MR341	open pit	500,000
Phase 3	Rietfontein Mine	MR358 & MR10161	underground	779,800
Phase 4	Beta Mine	MR83	underground	1,028,000
TOTAL				2,541,863

PHASE 1 (Theta Hill North - Browns Hill - Columbia Hill [Iota] Open Pit Project in MR83)

Phase 1 of management's 4 Mine Strategy consists of surface mining three locations on the southernmost portion of MR83, along with waste rock dumps and select areas sampled by Rand Mines in the 1990's. All three primary locations (Theta Hill, Browns Hill and Columbia Hill) are situated between 700m to 3km from the existing CIL processing plant and tailings-storage facilities. Significant progress has been made toward initiating gold production, namely defining the resources, completing a feasibility study and optimizing it and selecting a mining contractor for trial mining.

To date, management has significantly advanced the Theta Open Pit Starter Project and has completed many critical developmental milestones.

Theta Open Pit Starter Project - Developmental Milestones

Oct. 2018	Completed scoping study on open-cut mining at Theta Hill
May 2019	Open pit Feasibility study completed
Aug. 2019	Completed optimized plant layout
Oct. 2019	Purchased used 2.5MW ball mill
Jan. 2020	Completed optimized plant design study
Feb. 2020	Developed new Mineral System model for Eastern Transvaal Gold Fields
Feb. 2020	Submitted Environmental Authorization (EA) for open pit surface mining on MR 83
March 2020	Ball mill delivered to site
April 2020	Phase 1 Theta Open Pit Starter Project optimization study (added 33,158 oz. Au)
July 2020	Selected Digmin Group as the preferred mining contractor
Oct. 2020	DMRE supports EA to permit open-pit mining on MR83

Feasibility Study

Completed in May 2019 (and now outdated), the initial feasibility study only called for the mining of the Theta Hill, Browns Hill and Columbia Hill near-surface deposits. At the time, gold was trading in the \$1,270-to-\$1,310 per ounce range. Management conservatively used a base case with a gold price assumption of \$1,257. At that price, the project's processing rate was expected to be 500,000 tons per year, which over the five-year LoM would **recover 200,905 ounces Au** providing a projected post-tax **internal rate of return (IRR) of 65.1%**. The **payback period** from the start of production was estimated to be **14 months**.

Optimized Feasibility Study

An optimized study completed in April 2020 improved the economics and commercial viability of Phase 1. Though management conservatively highlights the base case that uses a gold price of \$1,500 per ounce, we believe that the stretch case (at \$1,600 an ounce) more realistically reflects the current gold price environment; hence, we will use those figures.

The **optimized study increased the ROM** ore with material from certain nearby waste rock dumps (an Inferred Resource) and select areas sampled by Rand Mines in the 1990's. Furthermore, the processing rate was increased to 600,000 tons annually. Consequently, the **LoM** increased from 5 years to **6 years and eight months**.

The gold recovery increased 16.5% to **234,063 ounces**. As a result, LoM EBITDA is now projected to be US\$181.4 million compared to the former US\$99.6 million, boosting the expected **IRR to 157%**.ⁱⁱ The peak funding requirement is estimated to be US\$26.7 million.

With higher grade ore being mine and process first, the **payback period** from the start of production is estimated to be only **six months**. In addition, **gold production in the first year** of mining operations has been increased to **49,500 ounces** versus 46,300 ounces in the Feasibility Study completed in May 2019.

Optimized Feasibility Study Theta Open-Pit Starter Project (MR83)

Real Discount Rate	Unit	US\$1369/oz Case	US\$1500/oz Case	US\$1600/oz Case

Theta Gold Mines Annual Report 2020

Infrastructure

Due to the historic mining activities in the area, Theta Gold Mines owns a processing plant near Pilgrims Rest. The site is easily accessible by road and has access to electrical power and water through properly permitted licenses. In addition, the company also has a large storage facility at Sabie.

Processing Plant

The company's processing plant site includes a **carbon-in-leach (CIL) circuit processing plant**, office building, store, machinery sheds, laboratories and equipment sheds. Also, there is a **tailings storage facility** with a capacity of 2.5 million tonnes of tailings material.

Theta Gold Mines Processing Plant Layout

Theta Gold Mines Press Release April 20, 2020

Mining Sites

The mine sites of the company's Phase 1 Theta Open Pit Starter Project are located within MR83, right on the border with MR341. The site of the company's processing plant lies on MR341, right on the border with MR83 and less than 3km west of Theta Hill.

Milling Capacity

Under the optimized plant study that was completed in January 2020, the CIL processing plant is designed to operate at a capacity of 600,000tpa, an upgrade from the initial feasibility study (released May 2019), which recommended a capacity of 500,000tpa.

The recently acquired **ball mill**, which has a nameplate **capacity of 820,000tpa**, easily meets the requirements of the optimized plant study. At the time of the initial feasibility study, the facility was equipped with a legacy ball mill with a capacity of 240,000tpa.

In October 2019, the company purchased a previously-owned 2.5 megawatt (MW) ball mill for ZAR 5.5 million (US\$360,000). The cost for disassembly and transportation from Rustenburg to the plant site near Pilgrim's Rest was approximately US\$165,000. The ball mill was delivered to the CIL plant site in late-March 2020.

The unit appears to be in excellent condition and comes with a spare girth gear, two spare motors, two spare gearboxes, seven spare slip pads and many other key parts and spares. A comparable new ball mill with spares would cost approximately US\$3.6 million. The newly acquired ball mill significantly upgrades the plant's milling capacity.

The **tailings storage facility** is also compliant with the optimized study, since it is approved to operate at a disposition volume of up to **600,000tpa**.

Mining Contractor

In July 2020, Theta Gold Mines contracted **Digmin Group** to perform the trial mining activities at the Phase 1 Starter Theta Project. Once the permitting process has been successfully completed, Digmin will conduct two box cuts at the nearby Iota and Browns Hill pits. The trial mining exercise will help management select the appropriate grade control practices to be used at Starter Theta Hill Project. Thereafter, management expects to negotiate a final mining contract with Digmin.

Funding of Capital Expenditures

Phase 1 of management's 4 Mine Strategy requires a relatively low level of capital expenditures. The initial feasibility study completed in May 2019 estimated that the total capital required was US\$34.26 million, of which US\$6.89 million was directed towards mining and US\$25.53 million was allocated to refurbishing the plant and tailings storage facility. However, according to the latest optimization study (completed in April 2020), the **total capital requirement** needed to **implement Phase 1** will be only **US\$31.4 million**.

Relying on the latest optimization study, management believes that the **peak funding requirement** will be approximately **US\$29 million**. The latest optimization study also estimates that at a \$1,600 gold price (stretch case) the payback period should be only six months, based on the mine schedule to process high grade material first. Given the relatively small amount of capital funding required, a short estimated build time of only nine months and the quick payback period, it is difficult to foresee that it would be difficult for the company to find the financing necessary to fund Phase 1.

Permitting Status

March 2011	Granted Water Use License
March 2011	Tailings storage facility approved for the disposition of residues for 2.5 million tons at rate of up to 600,000tpa
Oct. 2013	Granted underground mining permit in MR83
Oct. 2013	Plant permitted for the processing of ore

With management having made the decision to pursue an open cut operation to mine near-surface reefs in the vicinity of Theta Hill/Browns Hill/Iota, the necessary permit documentation for **amending the underground mining permit to allow surface mining on MR83** was submitted to Department of Mineral Resources and Energy (DMRE) in February 2020. The final comment was received from the South African Heritage Resources Agency (SAHRA) on October 7, 2020. The process is in the final stages of the Environmental Assessment (EA). On October 26, 2020, the DMRE wrote a letter of support for Theta's application. **A decision is expected by the end of November 2020.**

Pathway to Production

- A previously-owned ball mill was acquired in October 2019 in order to boost the processing capacity of the CIL plant. The ball mill was delivered to the plant site in March 2020 and is awaiting refurbishment.
- The permitting process is almost complete except for the amendment granting approval for surface mining on MR83. The approval of the company's Environmental Assessment (EA) is pending.
- **At least US\$30 million in funding will be required** to implement Phase1.

Upcoming milestones (expected in next three quarters)

- 1) Completion of surface mining permitting process for the Theta Open-Cut Starter Project on MR 83. The EA is nearing completion. The DMRE supports the approval of the amendment that would allow for surface mining.
- 2) Completion of detailed engineering design plan for CIL processing plant
- 3) Secure financing for refurbishing and upgrading the CIL processing plant
- 4) Select a plant construction contractor to bring the CIL processing plant on line
- 5) Begin refurbishment of ball mill & CIL processing plant
- 6) Complete current program of underground exploration work at Rietfontein and Beta Mines
- 7) Secure final project financing for mining operations
- 8) Select mining contractor and sign contract

Upcoming exploratory milestones

- 1) Complete geo-technical drilling program for numerous underground mines
- 2) Exploration to increase underground mining reserves
- 3) Pre-feasibility study on numerous underground mines (expected in 1Q 2021)
- 4) Start drilling program to expand resource in Theta Hill area
- 5) Conduct geophysical surveys guided by new gold mineralization system model

Currently, management is in discussions with five engineering firms for the construction contract to refurbish the CIL processing plant

If all items on timetable proceed according to plan, within the next 12 months, Theta Gold Mines should be able to

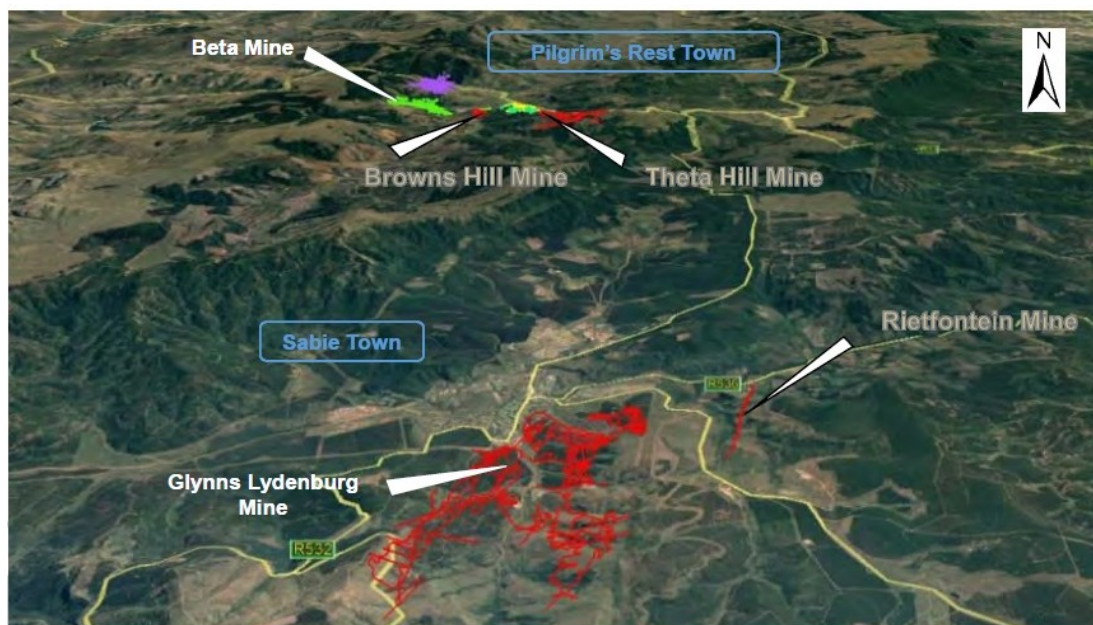

- 1) start the refurbishment and expansion of the gold processing plant and
- 2) commission the beginning of mining activities

PHASE 2 (Theta Hill South – MR341)

Phase 2 is simply an **open pit extension of the same ore body** from Theta Hill and Browns Hill in Phase 1 that crosses the boundary from MR 83 into **MR 341** (see the blue arrows in the map at the beginning of the Phase 1 section). Approximately 500,000 ounces of gold are available to convert into a Mining Reserve through a definition drilling program. Management estimates that during Phase 2, the annual goal production rate will be able to be increased to at least 80,000 ounces.

PHASE 3 (Rietfontein Mine - shallow underground mine)

The **Rietfontein Mine** (on MR358 and MR10161) is the mining target for **Phase 3** of the company's five-year 4 Mine Strategy. The project is located at approximately 40 km from the CIL processing plant on MR341.

Theta Gold Mines (formerly Stonewall Resources) Presentation January 2108

The Rietfontein project has been advanced with a **Scoping Study** (completed in February 2017) and an **Estimated Resource** (May 2017 and upgraded in September 2018). This brownfield project with **3km of underground workings** is **fully permitted for underground mining**.

Phase 3 targets shallow, high-grade (average grade 8.42 g/t) reef deposits, primarily in quartz vein structures. The company plans to mine and truck pregnant ore to the CIL processing plant. The gold mineralization consists of both horizontal flat line reefs and vertical components, the latter formed in structural traps that will require stope mining techniques.

Rietfontein Milestones

Feb. 2017	Scoping Study on Rietfontein Mine
May 2017	Updated Scoping Study on Rietfontein Mine
Sept. 2018	Gold mineral resource upgraded to 779,800 oz. Au

A scoping study was completed on the Rietfontein underground mine in February 2017. The study indicated that the mine contained an estimated resource of 2.55 million tonnes grading 11.02 g/t for 905,000 ounces of gold. The scoping study was updated in May 2017, in which the suggested mineable resource was 1.47 million tonnes grading at 9.51g/t Au. The estimated contained gold was 448,000 ounces with 387,000 ounces recoverable, assuming 10% dilution and a recovery rate of 86%.

Subsequently, the estimated mineral resource of the Rietfontein Mine was revised to 4.59 million tonnes grading 8.42 g/t for **779,800 ounces of gold** in September 2018.

Mineral Resources - Rietfontein Mine

Resource Classification	Reef Grade	Stope Grade	Reef Width	Stope width	Reef Tonnes	Stope Tonnes	Au Content

Total Indicated	14.57	8.20	52	92	0.52	0.92	7,534	242.2
Total Inferred	14.06	8.52	57	94	1.19	1.96	16,721	537.6
Total	14.21	8.42	56	94	1.71	2.88	24,255	779.8

Theta Gold Mines (formerly Stonewall Resources) Presentation October 2018

Management has plans for further exploration of the Rietfontein Mine in order to upgrade and expand the estimated mineral resource. The Rietfontein Mine sits in 16km structure with only 3km of confirmed gold mineralization. The ore body is open at depth and along strike. The campaign includes sampling, drilling and metallurgical test work.

Theta Gold Mines Presentation April 2020

Stage 3

Rietfontein shallow underground mine (MR358/10161)

- 780Koz @ 8.5g/t JORC Resources
- Scoping Study completed May 2017 (further study planned in 2020)
- Production targeting >40Kozpa
- Underground access in progress preparing for drilling/sampling (since Jan 2020)
- Processing via existing TGME plant site

Theta Gold Mines Presentation October 2020

In 2018, the mine was partially dewatered by natural decant, and the underground incline was improved for better access to level IV. In 2020, the surface adit entrance to level IV was opened, and underground samples were gathered for metallurgical test work, the results of which are expected in November.

Work continues on the preparation of a Preliminary Feasibility Study on the Rietfontein underground mine. In the meantime, the company is attempting to confirm that permits are in place for underground mining and potentially for surface mining in the area. Also, an optimized study for advanced underground mining techniques is expected to be released in late-2020.

PHASE 4 (Beta Mine - shallow underground mine)

Phase 4 consists of mining the underground mineral resource at the Beta Mine in MR83 and transporting the ore to the company's CIL processing plant, which is situated immediately adjacent to the Beta Mine in MR341. The Beta deposit is permitted for underground mining in both MR83 and MR341; an area west of the Beta Mine (located in MR330) has an underground mining permit pending.

The current estimated mineral resource at the Beta Mine is 5.7 million tonnes grading at 6.10 g/t for **1.086 million ounces of gold**, of which 48% is in the Indicated category. Work continues on the preparation of a Preliminary Feasibility Study on the Beta underground mine.

Beta Mine Milestones

May 2017 **Scoping Study** completed on Beta Mine
 Sept. 2018 Gold mineral **resource upgraded** to 1.086 million oz. Au

Theta Gold Mine (formerly Stonewall Resources) Press Release September 26, 2018

GOLD RESOURCE ESTIMATES

In 2010, when Stonewall Resources (now named Theta Gold Mines) acquired TGME, which includes the Sabie Mines properties. The total (Measured, Indicated and Inferred) estimated mineral resource was 2.794 million ounces of gold. In May 2013, a Competent Person's Report (that included additional resources for Dukes Hill and the Beta Main Rock Dump) increased the estimated mineral resource to 2.823MM oz. Au. Over time, management has undertaken multiple drilling campaigns, which have resulted in upgrading the resource six additional times, with the most significant increases occurring in 2018 and 2019.

Recent Total Resource Upgrades

April 2018 Increased Total Mineral Resources to **5.15 million ounces** from 3.72 million ounces
 • Driven by a geological modeling project

Sept. 2018 Total Mineral Resources increased to **5.75 million ounces**
 • Added Maiden Resource on Theta Open-Pit Starter Project

May 2019 Increased Total Mineral Resources to **6.03 million ounces**
 • Added Ore Reserve statement on Theta Open-Pit Starter Project

Looking back at relatively recent prior increases in the estimated mineral resources, the 38% increase in resources to 5.147MM oz. Au in **April 2018** was driven by a **geological modeling project**, along with new open-cut discovery at **Vaalhoek** that was included in the estimated resource. The modeling project involved a **reinvestigation of the historical data** for the purpose of collating, capturing and digitizing the information from historic production and sampling since 1873 (along with 20,000+ meters of drilling results) and then **applying modern modeling and estimation techniques**. Also, during the process of reviewing historical information, additional historical sampling data was uncovered.

Not only did the modeling project incorporate the use of **3-D electronic geological models**, but also four types of digital 3-D models were utilized on the different types of ore bodies, namely a sub-vertical discordant reef model for cross reefs, a sub-horizontal concordant reef model for leaders, topographical surficial reef model for eluvial deposits and a topographical TSF model for tailings and dumps. The modeling project led to a 146% increase in Mineral Resources at **Glynn's-Ladenburg**

Importantly, the modeling project identified a number high grade, **shallow reef structures amenable to open pit mining**, specifically at Theta Hill, Browns Hill and Columbia Hill. **This lends to greater confidence in management's Phase 1 project.**

Project	Type of Potential	Comment
Rietfontein	Lateral and depth extensions	Lateral extension is possible to the south which is untested as well as at depth below the current historical mine
Beta	Lateral extension	Lateral extension of the main Beta "payshoot"
CDM	Lateral extension	Lateral extension to the south toward Dukes Hill south
Vaalhoek	Depth extensions and open pit opportunities	Near surface potential exists on the Vaalhoek reef and Thelma Leader reef
Glynn's Lydenburg	Shallow lateral extensions	The new model has identified new high grade exploration targets for possible near surface open pit opportunities
Theta and Browns Hill	Shallow lateral extensions	The new geological interpretation has identified Theta Hill and Browns Hill as potential open pit targets that are currently being drilled
Columbia Hill	Shallow lateral extensions	The new geological interpretation has identified Columbia Hill as potential open pit target that will be drilled

Theta Gold Mines (formerly Stonewall Resources) Press release May 1, 2018

The driver of the increase in the mineral resources in **September 2018** was the **maiden Mineral Resource** for the **Theta Hill Open Cut Starter Project**, which added **599,710 oz. Au** to the total estimated mineral resource.

Theta Hill - Maiden Open Pit Resource

Resource Classification	Open Pit Mine	Reef	Diluted	Diluted	Diluted	Au Content	
			g/t	cm	Mt	Kg	K Oz

Theta Gold Mines Press Release September 26, 2018

In May 2019, Theta Gold Mines upgraded the **gold resource** to a total of **6.026MM oz.** grading at 4.18 g/t, which is a **101% increase since June 2014**. Of the total, **1.312MM ounces are open pit resources**. Most recently, the exploratory drilling campaigns have focused on expanding the indicated mineral resource for the **Theta Open-Pit Starter Project** (Phase 1 of management's 4 Mine Strategy).

Estimated Total Mineral Resources

Theta Gold Mines Press Release May 16, 2019

Estimated Resources and Reserve for Phase 1 Theta Open-Pit Starter Project

In preparation for implementing the company's Phase 1 Theta Open-Pit Starter Project, management has conducted drilling campaigns to better delineate and estimate the minable resources in the Theta Hill area. In a drilling program that commenced in November 2017 and continued through May 2019, 371 vertical holes were drilled totaling 18,857 meters. Consequently, the increased estimated mineral resource that was announced in **May 2019** also included an **Estimated Mineral Resource** and an **Ore Reserve statement** for the **Phase 1 Theta Open-Pit Starter Project**. In addition, there were adjustments to the Optimized Mining Plan.

Estimated Mineral Resources for Theta Project

Mineral Resource Classification	Open Pit Mine	Reef	Reef Grade	Reef Width	Content	Reef Tonnes	Au Content	
			g/t	cm	cm.g/t	Mt	Kg	koz
Indicated	Total Theta Project	All	2.14	246	526	5.2	11,157	358.7

Total Indicated and Inferred			2.70	190	514	10.1	27,359	879.6

Theta Gold Mines Press Release May 16, 2019

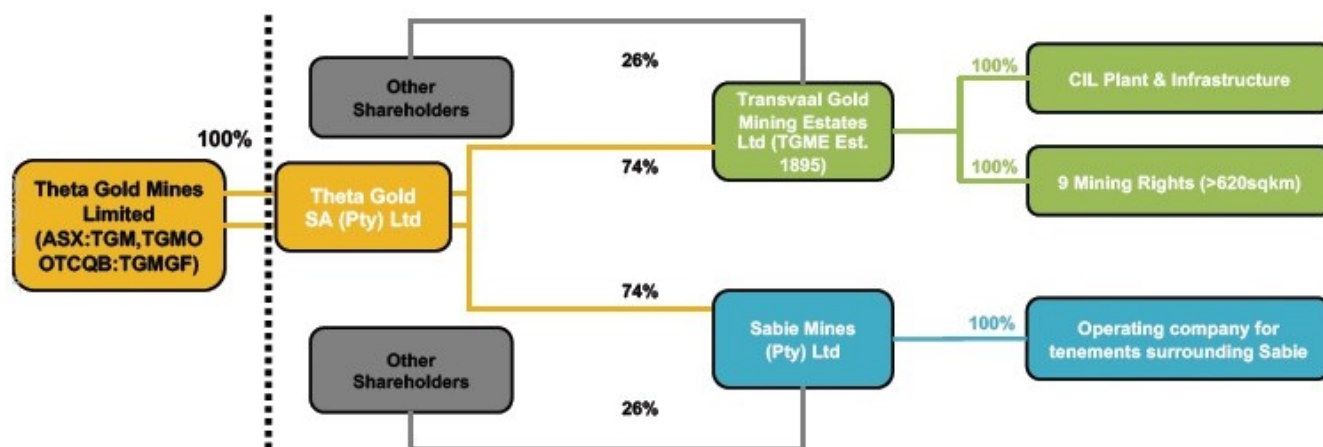

The estimated total Mineral Resources (Indicated and Inferred) for the Theta Open-Pit Starter Project are 879,600 ounces of gold with an average grade of 2.7g/t. The Mineral Resources in the Indicated category include the estimated Ore Reserve presented in the table below. The Theta Project does

not yet contain any Mineral Resources in the Measured category. The Ore Reserve calculation appears to have been provided to give further clarity to the ROM ore planned under Phase 1.

CORPORATE STRUCTURE AND OWNERSHIP

Theta Gold Mines owns 74% of both the TGME Project and Sabie Mines Limited, with the remaining 26% being held by Black Economic Empowerment (BEE) entities. The Project is fully BEE compliant. In this case of TGME, the BEE group consists of the TGME Black Employee Trust, TGME Community Trust, Distant Sunset Investments 27 P/L and TGME Land Claimants Trust. For Sabie Mines Ltd, the BEE stakeholders are the Sabie Black Employee Trust, Sabie Community Trust and Distant Sunset Investments 27 P/L.

Corporate Structure of Theta Gold Mines

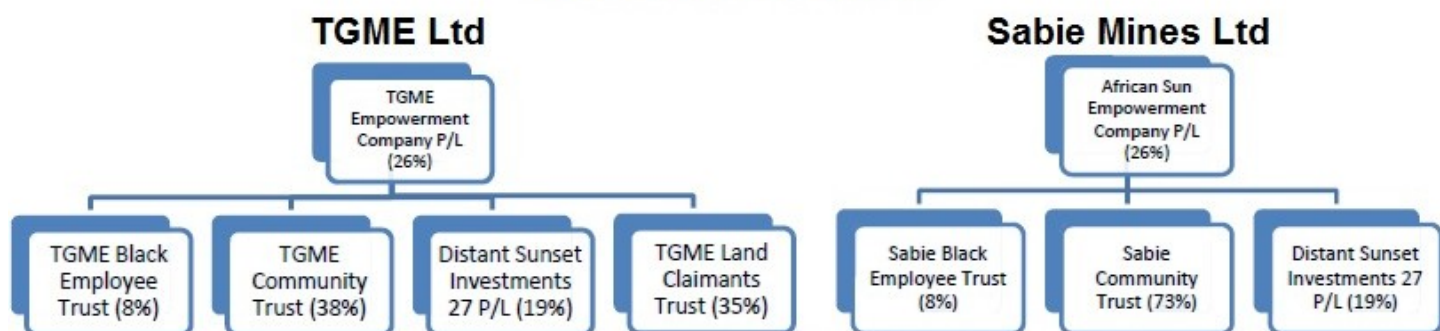

Other Shareholders 26% equity interest is a contributing equity interest

- Employees Trust (Employee/labour Incentives)
- Environmental Sustainability Trust (to be established)

Theta Gold Mines (formerly Stonewall Resources) 2017 Annual Report

Following the initial gold discoveries in the Pilgrim's Rest-Sabie area in 1873ⁱⁱⁱ and the subsequent gold rush, the **Transvaal Gold & Land Exploration Company** was established in 1882. As a result, the company is now South Africa's oldest gold mining concern. In 1895, Transvaal Gold & Land combined the great majority of local mining companies and gold mining interests to form, through an amalgamation, one large entity, **Transvaal Gold Mining Estates Ltd** (TGME).

OWNERSHIP

In 1895, **Transvaal Gold Mining Estates Ltd** (TGME) was formed through the amalgamation of almost all the local mining companies in the vicinity of Pilgrim's Rest. In the same year, **Glynn's Lydenburg Ltd** was formed in the environs of Sabie, now a small town (then a village) 20 miles south of Pilgrim's Rest. When established, **Glynn's Lydenburg** held 803 claims; over time, the holdings increased to 3,887 claims in 1955 when it was acquired by TGME. The time period between 1873 and 1967 was characterized by the discovery and development of many gold deposits in the Pilgrim's Rest and Sabie Gold Fields, one after the other, with gold constantly being produced every year, though at varying levels.

Outline of Ownership

- 1882 Transvaal Gold & Land Exploration Company (TGLE) established^{iv}
- 1895 **Lydenburg Mining Estates Ltd** (LME) formed (amalgamated TGLE with small mining cos.)
- 1895 **Glynn's Lydenburg Ltd** formed (amalgamated small mining companies around Sabie)
- 1896 LME changed named to **Transvaal Gold Mining Estates Ltd** (TGME)
- 1896-early 1900's: TGME and Glynn's Lydenburg Ltd continuously acquired subsequently formed gold companies and mineral claims in their respective areas
- 1955 TGME acquires **Glynn's Lydenburg Ltd** (subsequently name changed to Sabie Mines Ltd)
- 1968 TGME acquired by **Rand Mines Properties Ltd**
- 1992 **Randgold & Exploration Ltd** acquired TGME as a result of a restructuring of Rand Mines^v
- 1998 TGME acquired by **Simmer & Jack Mines Ltd**
- 2010 TGME acquired by **Stonewall Mining Proprietary Limited** for R25 million (closed in 2012)
- 2012 **Meridian Resources Limited** (ASX: MRJ) acquired Stonewall Mining (back door listing)
- 2012 Meridian Resources changed name to **Stonewall Resources Limited** (ASX: SWJ)
- 2013 Shandong Qixing Iron Tower Co. Ltd launched takeover of Stonewall (US\$141.5 million cash)
- 2014 Termination of Shandong Qixing deal announced on November 21
- 2015 Stonewall filed claim against Shandong Qixing Iron Tower Co. Ltd for non-completion of offer
- 2018 Stonewall received arbitral award (\$A5.0 million) from Shandong (nka Northcom Group Ltd)
- 2018 Stonewall Resources Ltd changed name to **Theta Gold Mines Ltd** (ASX: TGM)

PRODUCTION HISTORY

Total historical gold production from the Pilgrim's Creek and Sabie Gold Fields is estimated to be approximately **5.5 million ounces of gold**. This estimate is conservative due to many factors. Records are sparse during several time periods, particularly during the early prospecting years between 1873 and 1895 and when the mining rights were in hands of private companies, principally Rand Mines between 1968 and 1998.

From the **initial discoveries** of alluvial gold on the Geelhoutboom and Elandsdrift farms near Sabie and in Pilgrim's Creek (**all in 1873**) through the 1880's, gold production (fine dust to large nuggets) was derived overwhelmingly from small-scale operations that extracted alluvial gold from placer deposits in the beds and banks of streams within the Pilgrims Rest-Sabie Gold Fields. Subsequently, in the 1880's, prospectors commenced shallow underground mining operations in the pursuit of lode gold through shallow open cuts and by tracing reef horizons and quartz leaders that extended from surface outcrops.

Between 1873 and 1968, approximately **5.18 million ounces of gold was recovered** from the alluvial workings and mines in the two goldfields: 3.94 million ounces from the Pilgrim's Rest Goldfield and 1.241 million ounces from the Sabie Goldfield.^{vi} The average grade of the ore has been estimated to be 10.35 g/t.^{vii} At least 43 separate mines have been documented.

In 1968, Rand Mines Properties Ltd acquired TGME and Sabie Mines, and **in the 1970's**, the metallurgical plant processed old sand and tailings dams, along with waste rock dumps (under the Neptune Project). After some financial challenges due to exploratory expenses pursuing the Bentley Project, in due course, the properties were **acquired by Simmer & Jack Mines Ltd in 1998**. Gold **production commenced again in late-1999**. Initially, ROM (run of mine) ore was extracted from the Clewer and Morgenzon mines. Duke's Hill came on line in 2003, and Frankfort Mine began producing in 2005. By 2009, the processing plant was receiving ore from surface mining at Elandsdrift and from underground deposits at Theta Mine. Gold production ramped up from 2,765 ounces in 1999 to 10,449 ounces in 2006. Production levels hovered in the 9,000-to-11,000 ounce range through 2009. Simmer & Jack Mines Ltd placed the TGME operation and mines on care and maintenance in the first calendar quarter of 2010. **Gold production from 1968 through 2010** was approximately **230,000 oz. Au**.

In September 2010, Theta Gold Mines (at the time Stonewall Mining) acquired TGME, and by April 2011, a bulk test project commenced in order to extract gold from tailings dams, dumps and reef residue material (from both surface and underground sources). The small-scale project utilized a fine and ultra-grind preparatory circuit. Total production from **bulk testing project between mid-2011 and the first half of 2014** was approximately **11,474 oz. Au**.

FINANCINGS

To date, Theta Gold Mines has been successful in raising capital so that management has been able to continue advancing its 4 Mine Strategy. **During fiscal 2020**, the company received **net proceeds of US\$5.73 million** from the placement of shares and the exercise of options resulting in the issuance of approximately 58,378,000 shares.

Subsequently, in late-July 2020, Theta Gold Mines closed an oversubscribed share placement and issued 16,667,084 ordinary shares priced at \$0.24 per share. **Gross proceeds were approximately A\$4,000,100 (USD\$2.81 million)**. The net proceeds will be used primarily to accelerate the development of the Theta Open Pit Starter Project in South Africa. Sanlam Private Wealth acted as the lead manager of the placement.

RECENT NEWS

Phase 1 - Progress Reports

On October 26, 2020, Theta Gold Mines was informed by the **DMRE** (the South African Department of Mineral Resources and Energy) that it **supports Theta's application** to amend MR 83, which requests a **permit for open pit mining**. The last step in the process is the approval of the application for Environmental Authorization (EA) to permit open-pit mining on MR83. Currently, the application is being reviewed. **A decision is expected by the end of November 2020**. MR 83 already is approved for underground mining, the processing of ore and the use of an existing tailings dam.

In the October 26, 2020 investor presentation, management set forth a timetable stating that certain milestones are expected to be achieved by the end of November, namely:

- a solution to funding and construction of the CIL processing plant
- the completion of a detailed engineering design plan for the CIL plant
- the commencement of refurbishment work on the higher capacity ball mill

VALUATION

Managements of junior mineral exploration companies create value through evaluating, acquiring, exploring and/or developing mining properties. **Management's 4 Mine Strategy** is to increase shareholder value by bringing the brownfield mines in the Pilgrims Rest and Sabie Gold Fields back into production using modern exploration, mining (particularly open pit) and processing techniques. With the refurbishment of the mill and processing plant, along with a surface mining permit at MR83 expected to be granted soon, management is expected to be able to fast-track gold production in the Theta Hill area (Phase 1).

Our calculation of **share value of attributable resources** is based on the ascertained net asset value of each property, which is determined by **adjusting the value of estimated resources for the expected recovery rate and mining/processing costs**. Also, the resources are assigned a **confidence factor** that attempts to take into account the risks of each project, such as the locality of the deposits, the assurance level of the resources, various technical mining/production risks, etc. The methodology also accounts for balance sheet adjustments for working capital and assets, such as property, plant and equipment, along with anticipated development capital costs. The resource valuation methodology involves the following assumptions:

- 1) A 95% confidence factor is applied to the Phase 1 Project.
 - a. Phase 2 is not yet being assigned a valuation. We await further information concerning the 500,000 oz. Au resource. The company is engaged in exploration programs and studies to better define, expand and upgrade the resource.
 - b. Even though Scoping Studies have been completed on the Rietfontein and Beta Mines (Phase 3 and Phase 4), we await further drilling results and optimization studies. In the meantime, we are valuing the Indicated Resources with a very conservative 30% confidence factor for Rietfontein and 25% for Beta Mines.
 - c. Furthermore, even though portions of the Inferred Resources at the Rietfontein and Beta Mines are part of the potential mine development in their respective Scoping Studies, we are not incorporating these Inferred Resources into our valuation model.
- 2) Upon being refurbished, we value the fair market value of the processing plant at US\$5,000,000
- 3) The capital costs to bring the properties to commercial production (along with other relevant figures, such as estimated production life, ore grade, recovery rate, etc.) are derived from the appropriate Scoping Studies:

- a. Phase 1 - Theta Open Pit Starter Project Optimized Mine Schedule announced April 20, 2020
- b. Phase 3 - Rietfontein Mine Scoping Study announced February 28, 2017
- c. Phase 4 - Beta Mine Scoping Study announced May 16, 2017
- 4) Phase 3 and Phase 4 are expected to commence in 2026 and 2027, respectively.
- 5) A 10% discount rate is being applied in all of our Net Present Value (NPV) calculations.
- 6) The current gold price is used in our model.
- 7) Our asset value per share takes into account the dilutive effect of having options exercised below our target price.

Based on our calculation of share value of attributable resources (see table below), **our target for Theta Gold Mines stock is \$0.60.**

Theta Gold Mines Limited										
Projects	Metal	Indicated Resource (tonnes)	Grade Au (g/t)	Reserve/ Indicated In situ Metal Au (ozt)	Recovery Rate	Average Production Costs (\$US per tonne)	Current Metal Price (\$US)	Royalties (\$US)	Adj. Net Value to TGM (\$US)	Net Present Value to TGM

RISKS

- As with almost all junior resource exploration companies, currently Theta Gold Mines does not generate sufficient cash flow to adequately fund its developmental and exploration activities and is in need of additional capital to continue pursuing management's strategy. Nevertheless, the company has effectively funded its operations and initiatives to date.
- Shares outstanding increased significantly in fiscal 2017 (+20.7%), fiscal 2018 (+22.2%), fiscal 2019 (+56.5%) and fiscal 2020 (+13.4%) as capital from equity financings have funded the company's exploration and developmental activities, along with general corporate expenses. As a consequence, the company's share experienced a 10:1 consolidation (reverse split) in November 2018.
- As with any mineral company, the price of the targeted mineral is beyond management's control, in the case of Theta Gold Mines, the price of gold. Consequently, any significant movements in the price of gold would materially affect the outlook of the company.
- The project area is situated in one of the locales with the highest rainfall in South Africa, more than 1,200 mm per annum compared to the global average of 786 mm. Flooding can occur and has happened during the rainy season between October and April. Generally, underground and surface mining operations can continue during the rainy season; however, water ingress into the underground mines (flooding) has impeded gold production in the past, most recently in the first calendar quarter of 2014. Also, heavy rain can be problematic for heap leach operations.
- Operations may be adversely affected by labor disputes or changes in the labor laws either by work stoppages or increased employee expenses.
- The gold mineralization of the Pilgrims Rest and Sabie Goldfields is characterized by an assortment of gold mineralization styles, some highly irregular. As a result, certain challenges arise in the processing of ore that is naturally resistant to recovery by standard processes, primarily sulfide ore. Management is addressing the challenges of the gold mineralization styles by employing modern processing techniques. Significant advances have been made in gold recovery processes since the late 1960's, when large-scale mining was last conducted on the properties. Metallurgists have developed pre-treatment methods to effectively deal with gold ore that is resistant to extraction, which fall under the categories of crushing, washing, drying, chemical treatments, fractionalization and incineration. Among the specific methods are ultra-fine grinding; furnace roasting, bio-oxidation, chlorination, acid and alkaline pressure oxidation, and electrolytic oxidation, among others.

HISTORICAL STOCK PRICE

DISCLOSURES

The following disclosures relate to relationships between Zacks Small-Cap Research ("Zacks SCR"), a division of Zacks Investment Research ("ZIR"), and the issuers covered by the Zacks SCR Analysts in the Small-Cap Universe.

ANALYST DISCLOSURES

I, Steven Ralston, hereby certify that the view expressed in this research report accurately reflect my personal views about the subject securities and issuers. I also certify that no part of my compensation was, is, or will be, directly or indirectly, related to the recommendations or views expressed in this research report. I believe the information used for the creation of this report has been obtained from sources I considered to be reliable, but I can neither guarantee nor represent the completeness or accuracy of the information herewith. Such information and the opinions expressed are subject to change without notice.

INVESTMENT BANKING AND FEES FOR SERVICES

Zacks SCR does not provide investment banking services nor has it received compensation for investment banking services from the issuers of the securities covered in this report or article.

Zacks SCR has received compensation from the issuer directly, from an investment manager, or from an investor relations consulting firm engaged by the issuer for providing non-investment banking services to this issuer and expects to receive additional compensation for such non-investment banking services provided to this issuer. The non-investment banking services provided to the issuer includes the preparation of this report, investor relations services, investment software, financial database analysis, organization of non-deal road shows, and attendance fees for conferences sponsored or co-sponsored by Zacks SCR. The fees for these services vary on a per-client basis and are subject to the number and types of services contracted. Fees typically range between ten thousand and fifty thousand dollars per annum. Details of fees paid by this issuer are available upon request.

POLICY DISCLOSURES

This report provides an objective valuation of the issuer today and expected valuations of the issuer at various future dates based on applying standard investment valuation methodologies to the revenue and EPS forecasts made by the SCR Analyst of the issuer's business.

SCR Analysts are restricted from holding or trading securities in the issuers that they cover. ZIR and Zacks SCR do not make a market in any security followed by SCR nor do they act as dealers in these securities. Each Zacks SCR Analyst has full discretion over the valuation of the issuer included in this report based on his or her own due diligence. SCR Analysts are paid based on the number of companies they cover. SCR Analyst compensation is not, was not, nor will be, directly or indirectly, related to the specific valuations or views expressed in any report or article.

ADDITIONAL INFORMATION

Additional information is available upon request. Zacks SCR reports and articles are based on data obtained from sources that it believes to be reliable, but are not guaranteed to be accurate nor do they purport to be complete. Because of individual financial or investment objectives and/or financial circumstances, this report or article should not be construed as advice designed to meet the particular investment needs of any investor. Investing involves risk. Any opinions expressed by Zacks SCR Analysts are subject to change without notice. Reports or articles or tweets are not to be construed as an offer or solicitation of an offer to buy or sell the securities herein mentioned.

CANADIAN COVERAGE

This research report is a product of Zacks SCR and prepared by a research analyst who is employed by or is a consultant to Zacks SCR. The research analyst preparing the research report is resident outside of Canada, and is not an associated person of any Canadian registered adviser and/or dealer. Therefore, the analyst is not subject to supervision by a Canadian registered adviser and/or dealer, and is not required to satisfy the regulatory licensing requirements of any Canadian provincial securities regulators, the Investment Industry Regulatory Organization of Canada and is not required to otherwise comply with Canadian rules or regulations.
